RTOG 1205

RANDOMIZED PHASE II TRIAL OF CONCURRENT BEVACIZUMAB AND RE-IRRADIATION VERSUS BEVACIZUMAB ALONE AS TREATMENT FOR RECURRENT GLIOBLASTOMA

This trial is part of the National Clinical Trials Network (NCTN) program, which is sponsored by the National Cancer Institute (NCI). The trial will be led by NRG Oncology with the participation of the network of NCTN organizations: the Alliance for Clinical Trials in Oncology; ECOG-ACRIN Medical Group; and SWOG.

Study Chairs (8/24/15)

Principal Investigator/Radiation Oncology
Christina Tsien, MD
Department of Radiation Oncology
Washington University in St. Louis
4921 Parkview Place, Campus Box 8224
St. Louis, MO 63110
Phone: 314-362-8567/Fax: 314-362-8521
Email: ctsien@radonc.wustl.edu

Radiation Oncology Co-Chair
Adam P. Dicker, MD, PhD

See Section 5.0 for radiation therapy credentialing requirements. See Section 7.0 for details/doses of bevacizumab.

Patient Population: (See Section 3.0 for Eligibility)
Patients with recurrent glioblastoma or variant (gliosarcoma or giant cell glioblastoma etc).

Required Sample Size: 178
ELIGIBILITY CHECKLIST (10/9/14)

NRG Oncology Institution #
RTOG 1205
Case #

_____(Y) 1. Does the patient have histologically proven diagnosis of glioblastoma or variants per section 3.1.1?

_____(Y/NA) 2. Does patient have progression on contrast-enhanced MRI/CT within 21 days prior to registration as defined in section 3.1.1, bullet 1?

_____(Y/N) 3. Is there an interval of 6 months or greater between completion of prior radiotherapy and registration?
   ______(Y) If No, was one or more of the criteria in section 3.1.1 a, b or c met?

_____(Y/N) 4. Does the patient have a prior history of standard dose CNS radiation as defined in section 3.1.2?
   ______ (Y) If No, was one or more of the criteria in section 3.1.1 a, b or c met?

_____(Y/NA) 5. Has patient recovered from the toxic effects of prior therapy?

_____(Y/NA) 6. If patient received prior investigational agent(s) and/or prior cytotoxic therapy was there a minimum time of 28 days prior to registration? With the exceptions of vincristine (minimum time of 14 days), nitrosoureas (minimum time of 42 days) and procarbazine (minimum time of 21 days)

_____(Y/N) 7. Did the patient have a recent resection (within 5 weeks prior to registration) of the glioblastoma?
   If Y:
      ______(Y) Has the patient recovered from the effects of surgery?
      ______(Y/NA) Has a minimum of 7 days elapsed for core or needle biopsy?
      ______(Y) Was a postoperative or intraoperative scan performed prior to registration?

_____(Y) 8. Was a history and physical examination completed within 14 days prior to registration?

_____(Y) 9. Is the Karnofsky performance status greater than or equal to 60 within 14 days prior to registration?

_____(Y) 10. Is the patient’s age ≥18?

_____(Y) 11. Was a CBC with differential obtained within 14 days prior to registration with adequate bone marrow function as defined in section 3.1.8?

_____(Y) 12. Is there adequate liver and renal function within 14 days prior to registration as defined in section 3.1.8?

_____(N) 13. Does the patient have proteinuria within 14 days of registration as defined in section 3.1.9?

_____(N/NA) 14. Is the patient pregnant or nursing?
ELIGIBILITY CHECKLIST (9/3/15)

Case #

______ (Y/NA) 15. Was a pregnancy test done within 7 days before registration?

______ (Y/NA) 16. Is the patient willing to practice effective contraception while on study treatment and 6 months after? (women of childbearing potential and men)

______ (Y/N) 17. Is the patient on full dose anticoagulants?
   If Y:
   _______ (N) Does the patient have active bleeding or a pathological condition that carries a high risk of bleeding?
   _______ (Y) Is there an in-range INR (usually between 2 and 3) on a stable dose of oral anticoagulant or on a stable dose of low molecular weight heparin within 14 days prior to registration?

______ (Y) 18. Did the patient provide study-specific informed consent prior to study entry?

______ (N) 19. Has the patient had more than 3 relapses?

______ (N) 20. Is there infratentorial or leptomeningeal evidence of recurrent disease?

______ (N) 21. Does the patient have a recurrent or persistent tumor greater than 6 cm in maximum diameter?

______ (N) 22. Has the patient had prior therapy with an inhibitor of VEGF or VEGFR (including bevacizumab)?

______ (Y/N) 23. Has the patient had prior invasive malignancy (except non-melanomatous skin cancer)?
   If Y:
   _______ (Y) Has the patient been disease free for a minimum of 1 year

______ (N) 24. Does the patient have severe active co-morbidity as in defined in 3.2.6.?

______ (N) 25. Does the patient have prior allergic reaction to the study drug (Bevacizumab)?

______ (N) 26. Does the patient have prior history of hypertensive crisis or hypertensive encephalopathy?

______ (N) 27. Does the patient have a history of a non-healing wound, ulcer or bone fracture within 90 days (3 months) prior to registration?

______ (N) 28. Has the patient had gastrointestinal bleeding or any other hemorrhage/bleeding event CTCAE, v.4 grade 3 or greater within 30 days prior to registration?

______ (N) 29. Has the patient had major surgical procedure, open biopsy or significant traumatic injury within 28 days prior to registration (with the exception of craniotomy)?
The following questions will be asked at Study Registration:
IMRT CREDENTIALING AND IGRT CREDENTIALING (for reduced margins only) IS REQUIRED BEFORE REGISTRATION. PROTON CREDENTIALING IS REQUIRED IF USING PROTONS.

1.0 INTRODUCTION
1.1 Overview
Glioblastoma is the most common lethal primary brain tumor in adults (Brandes 2003). Despite optimal treatment including surgery, chemotherapy, and radiation, median survival of patients with glioblastoma is 14 months. The majority of patients will develop recurrence at a median of 8 months post treatment (Stupp 2005).

Patients with recurrent glioblastoma have poor prognoses and have been treated with various modalities including resection, chemotherapy, or re-irradiation. Prior phase II chemotherapy trials were associated with a 6-month progression-free survival of 15% and a median survival of 25 weeks (Wong 1999, Carson 2007). In 2009, bevacizumab, a humanized monoclonal antibody which targets VEGF, was approved by the FDA as a single agent for recurrent glioblastoma.

Vascular proliferation is a notable feature in glioblastoma; therefore, targeting the vascular endothelial growth factor (VEGF) is a logical treatment approach (Jain 2007). Anti-VEGF therapy can inhibit new vessel growth, lead to vascular regression and vascular normalization, as well as directly affect tumor cell function (Ellis 2008). Antiangiogenic therapies rapidly normalize leaky abnormal tumor vessels and therefore decrease vasogenic edema as well as the patient’s dependence on corticosteroids. This effect may lead to significant improvement in the patient’s quality of life (Vredenburgh 2010).

Several clinical trials have evaluated the safety and efficacy of bevacizumab alone or in combination with chemotherapy in recurrent gliomas. A single-institution phase II trial demonstrated increased response rates and prolonged 6-month progression-free survival (Vredenburgh 2007a; Vredenburgh 2007b). Thirty-two patients with recurrent grade III-IV glioma (Vredenburgh 2007a) received bevacizumab and irinotecan, showing promising activity with a 6-month progression-free survival of 38%. The median overall survival limited to grade IV patients was 9.2 months.

In a phase II trial, 48 heavily pretreated recurrent glioblastoma patients received single-agent bevacizumab, with a median progression-free survival of 16 weeks, 6-month progression-free survival of 29%, and a response rate of 35% based on Macdonald criteria (Kreisl 2009). A subsequent randomized, non-comparative phase II trial (BRAIN study) was performed and led to the FDA approval of single-agent bevacizumab. Patients with recurrent glioblastoma in first or second relapse were randomized to either bevacizumab 10 mg/kg every 2 weeks alone (85 patients) or in combination with irinotecan (82 patients). The estimated 6-month progression-free survival rate was 42.6% and 50.3%, respectively. Median overall survival was 9.2 and 8.7 months, respectively. The majority of patients in this trial had partial or complete resection (91.8% and 91.5%, respectively). A minority of patients (8% and 13%, respectively) were enrolled ≤3 months following radiotherapy, while 20% and 10%, respectively, were enrolled ≤3 months following surgery. Overall, treatment was well tolerated; adverse events related to bevacizumab included hypertension, fatigue, and deep vein thrombosis. There was no clear increase in efficacy with the addition of irinotecan; however, there was increased toxicity (Friedman 2009). Despite the significant increase in response rates and 6-month progression-free survival with single-agent bevacizumab, the median overall survival remains 8 to 9 months.

Several phase II trials have attempted to combine bevacizumab with other chemotherapy agents, with no significant improvement in outcome. These agents include daily low-dose temozolomide, etoposide, erlotinib, and nitrosourea. In fact, these trials identified increased toxicity with no improvement in efficacy (Verhoeff 2010; Gilbert 2009; Hasselbach 2010; Reardon 2009; Sathornsumetee 2010). Response rates to chemotherapy following bevacizumab failure are exceptionally poor. Salvage chemotherapy provided only transient tumor control with an estimated 6-month progression-free survival of 2% (Quant 2009). Enrollment in a clinical trial for patients with recurrent glioblastoma should be the standard clinical practice and highlights the pressing need to identify novel strategies.
Salvage re-irradiation has long been offered as a treatment modality (Hudes 1999, Kim 1997, Laing 1993, Grosu 2005, Lederman 2000). Prior results obtained from over 300 glioblastoma patients confirmed a 6-month progression-free survival ranging from 28% to 39% and a median 1-year overall survival of 26% ranging from 18% to 46% (Combs 2005, Nieder 2008, Fogh 2010). However, recent advances in RT techniques including fractionated stereotactic radiotherapy (FSRT), protons, and IMRT, now allow for highly conformal treatment, which has the potential to significantly reduce the toxicity associated with re-irradiation (Fogh 2010).

Several studies report an improvement in 6-month functional status as well as a reduction and discontinuation of corticosteroid usage (Laing 1993; Kim 1997; Nieder 2008; VanderSpek 2008). Late CNS toxicity was uncommon especially following FSRT. Combs et al reported on 172 recurrent gliomas with a median time from RT to re-radiation of 10 months. Median tumor size for glioblastoma tumors was 47.7 cc. RT dose was 36 Gy in 2 Gy fractions given 5 fractions per week. Progression-free survival for 59 glioblastoma patients following re-irradiation was 5 months, with a median overall survival of 8 months. Factors associated with improved outcome included histology, extent of initial resection, and age at primary diagnosis. Treatment was well tolerated, with 1 incidence of radiation necrosis (Combs 2005).

Fogh et al reported on 147 high-grade glioma patients treated with FSRT delivering 35 Gy in 10 fractions. Median time to re-irradiation was 8 months. Somewhat surprisingly, and in contrast with other reports, patients who received irradiation within 6 months of initial diagnosis did not demonstrate an inferior survival. Median tumor volume was 22 cc. Eighty-four patients underwent salvage surgery prior to re-irradiation. Forty-eight patients received concurrent chemotherapy such as temozolomide. Median survival was 11 months. Treatment was well tolerated. Multivariate analysis suggested younger age and smaller tumor volumes were associated with improved outcome (Fogh 2010).

There is a clear rationale for combining bevacizumab with re-irradiation to increase the therapeutic ratio through increased antitumor and antivascular effects (Provencio 2010; Lee 2000). Preclinical data suggest that VEGF is up-regulated in response to radiation; therefore, the use of antiangiogenic agents combined with radiation may sensitize both tumors and associated vasculature to RT (Gorski 1999). Preclinical studies have demonstrated that antiangiogenic agents may uniquely target the radio-resistant and highly tumorigenic cancer stem cells by disrupting vascular niches harboring cancer stem cells (Hovinga 2010). Due to its potential radioprotective effects, especially the phenomenon of vascular stabilization, the addition of bevacizumab may also reduce the toxicity associated with re-irradiation by reducing risk of radiation necrosis (Levin 2011). Several phase II and phase III trials have reported on the initial safety and tolerability of combining bevacizumab and temozolomide with radiotherapy in primary glioblastoma patients (Lai 2010; Vredenburgh 2011).

Preliminary evidence suggests improved outcome with the addition of concurrent and adjuvant bevacizumab to re-irradiation. Gutin et al published results regarding 25 patients with recurrent grade III-IV glioma using FSRT and concurrent bevacizumab; with a reported 6-month progression-free survival of 65% and median overall survival of 12.5 months. Median time to radiation was 15 months. Enhancing tumor volume was ≤ 3.5 cm in maximum diameter. Treatment was well tolerated. There was no incidence of radiation necrosis and no additional need for corticosteroids following radiation (Gutin 2009).

The Duke group recently reported its single-institution retrospective data on 63 patients with recurrent high-grade gliomas, including 49 glioblastoma patients treated with re-irradiation using SRS techniques combined with bevacizumab therapy. The treatment regimen was noted to be well tolerated. Median time to re-irradiation was 19.6 months. Mean number of systemic therapies prior to SRS was 3.6 and mean number of therapies following SRS was 2.9. Median target volume was 4.8 cc. The 1-year overall survival in glioblastoma patients who received adjuvant (concurrent with or after SRS) bevacizumab was 50% vs. 22% for patients not receiving adjuvant.
bevacizumab ($p=0.005$). Both age $<50$ years and performance status $>70$ were associated with improved overall survival (Cuneo 2011).

Retrospective single-institutional experience in high-grade glioma patients treated with FSRT using 36 Gy in 18 fractions, with concurrent bevacizumab, followed by maintenance bevacizumab was recently reported. Overall survival appeared better in patients receiving bevacizumab (12.1 months) than those who had received either re-irradiation alone or concurrent with temozolomide (8.0 months). Treatment was well tolerated, with no incidence of radiation necrosis and one incidence of wound dehiscence (Niyazi 2010).

Based on the long history and clinical experience of re-irradiation of recurrent glioblastoma, we wish to obtain prospective multi-institutional safety and efficacy data regarding the combination of bevacizumab and re-irradiation in improving overall survival in bevacizumab-naive recurrent glioblastoma patients.

Therefore, the primary aim of this study is to provide preliminary evidence of an overall survival benefit with the addition of re-irradiation in combination with bevacizumab for patients with recurrent glioblastoma in a multi-institutional setting, in the context of a phase II randomized trial that will require further confirmation in a phase III trial.

### 1.1.1 Significance of the Current Study

RTOG 1205 is important in potentially changing the paradigm of treatment in recurrent glioblastoma. Despite numerous randomized chemotherapy studies as well as novel targeted agents studied to date, no regimens have shown significant improvement in overall survival compared to bevacizumab alone. Single-agent bevacizumab is currently the mainstay of treatment in recurrent glioblastoma, but the overall survival remains limited at approximately 8 to 9 months. Responses to therapy following bevacizumab failures are extremely poor. Preclinical data suggest that a resistant and invasive phenotype develops following bevacizumab failure, and salvage therapy remains ineffective in this context; therefore, this latter patient group will NOT be included in our trial.

The goal of this study is to test the hypothesis that re-irradiation combined with an effective targeted agent, bevacizumab, will improve the overall survival of bevacizumab-naive recurrent glioblastoma patients. This trial will also be the first prospective multi-institutional study to evaluate survival, response, and patterns of failure following re-irradiation. Further, if this trial is positive, the implication is that higher radiotherapy doses are potentially feasible and safe, and therefore, the addition of bevacizumab and re-irradiation in recurrent gliomas may provide the preliminary proof of principle to further study dose-escalated radiation in combination with bevacizumab in the upfront treatment of glioblastoma. Additionally, this trial could also potentially set the stage for testing additional chemotherapeutic and/or targeted agents with radiation in the recurrent glioblastoma setting. This could provide preliminary clinical data to move promising agents in the upfront setting in a more efficient manner.

### 1.2 Safety, Efficacy, and Rationale for Combination of Bevacizumab and Re-Irradiation

The safety and efficacy of hypofractionated stereotactic irradiation in combination with bevacizumab for recurrent glioblastoma was reported by Gutin et al (2009). The results were promising, with a 6-month progression-free survival of 65% and a median overall survival of 12.5 months. There were no incidences of radiation necrosis noted and there was no need for additional corticosteroids following treatment. The treatment was also safe and well tolerated. Grade 3 toxicity, including intratumor hemorrhage, wound dehiscence, and bowel perforation, was noted in 12% of patients. Retrospective results of hypofractionated stereotactic radiation alone using 35 Gy in 10 fractions in 147 high-grade glioma patients were reported by Fogh et al (2010). Median survival was 11 months. This underscores the safety and tolerability of this approach.

RTOG 0625, a phase II randomized study of bevacizumab and irinotecan or temozolomide, enrolled 123 patients and was recently published in abstract form (Gilbert 2009). ACRIN 6637
provided central review of all pre-treatment MRIs. Analysis of the pre-treatment MRI confirmed that over 90% of cases had an initial post-contrast T1 MRI tumor diameter of 5 cm or less. A statistical analysis was performed using this inclusion criteria (limiting to 5 cm or less), and demonstrated a median overall survival of 9.4 months for patients receiving bevacizumab and temozolomide and 7.6 months for patients receiving bevacizumab and irinotecan (Wang, RTOG 0625 summary analysis unpublished data). This preliminary analysis confirms the median survival of recurrent glioblastoma treated with bevacizumab at approximately 9 months and a basis for the inclusion of tumors limited in size to 5 cm diameter.

Re-irradiation using the newer SRS techniques delivers higher doses of irradiation to a considerably more precise target volume, in a single fraction, and with a steep dose gradient beyond the tumor. In several series reporting on these novel SRS techniques, overall survival was 9 to 11 months. Because of the potential CNS toxicity associated with a single-fraction treatment or treatment with very few fractions of large dose per fraction, patients selected for this therapy must have small, limited volume recurrences. Fractionation leads to improvement of the therapeutic ratio by reducing the risk to normal tissues compared with single-fraction treatments, especially for larger tumors (3 to 5 cm) (Brenner 1997, Cho 1999). The linear quadratic (LQ) model has been used to calculate the biological equivalent dose using a tumor alpha/beta ratio of 10 Gy (Mayer 2008). The effect on late normal tissue was calculated using an alpha/beta ratio of 3 Gy. The proposed schema in this study of 35 Gy in 10 fractions was directly compared to the 30 Gy in 5 fractions used by Gutin et al and was predicted using biologic modeling to have similar antitumor efficacy (47.2 versus 48 Gy with alpha-beta of 10 Gy). However, the 35 Gy in 10 fractionation scheme is much more favorable in regards to risk of late normal tissue toxicity and is likely better tolerated for larger tumors.

2.0 OBJECTIVES
2.1 Primary Objective
To establish an improvement in overall survival in recurrent GBM patients receiving bevacizumab and re-irradiation compared with patients receiving bevacizumab alone.

2.2 Secondary Objectives
2.2.1 To estimate and compare the rate of objective response in patients with measurable disease.
2.2.2 To estimate and compare the 6-month progression-free survival rate.
2.2.3 To estimate and compare progression-free survival.
2.2.4 To estimate and compare the rate of treatment adverse events.
2.2.5 To estimate and compare the rate of ≥grade 3 acute or delayed CNS toxicity.

3.0 PATIENT SELECTION
NOTE: PER NCI GUIDELINES, EXCEPTIONS TO ELIGIBILITY ARE NOT PERMITTED
3.1 Conditions for Patient Eligibility (8/24/15)
For questions concerning eligibility, please contact the study data manager.
3.1.1 Histopathologically proven diagnosis of glioblastoma or variants (gliosarcoma, giant cell glioblastoma etc). Patients will be eligible if the original histology was lower-grade glioma and a subsequent diagnosis of glioblastoma or gliosarcoma is made.
• Patients who did not have recent surgery for their glioblastoma must have shown unequivocal radiographic evidence for tumor progression by contrast-enhanced MRI scan (or CT scan for patients with non-compatible devices) within 21 days prior to registration as defined in Section 11.4.1.
Note: Patients who did have surgery with a post-operative contrast-enhanced scan falling outside the 5-week window prior to registration, per definition of recent surgery in 3.1.4, must have a repeat MRI scan (or CT scan for patients with non-compatible devices) within 21 days prior to registration.
• Patients must have passed an interval of 6 months or greater between completion of prior radiotherapy and registration. If patients have not passed an interval of at least 6 months, they may still be eligible if they meet one or more of the following criteria:
a) New areas of tumor outside the original radiotherapy fields as determined by the investigator, or 
b) Histologic confirmation of tumor through biopsy or resection, or 
c) Nuclear medicine imaging, MR spectroscopy, or MR perfusion imaging consistent with true progressive disease, rather than radiation necrosis obtained within 28 days of registration AND an interval of at least 90 days between completion of radiotherapy and registration.

- Patients unable to undergo MR imaging because of non-compatible devices can be enrolled provided CT scans are obtained and are of sufficient quality. Patients without non-compatible devices may not use CT scans performed to meet this requirement.

3.1.2 Prior history of standard dose CNS radiation of 60 Gy in 30 fractions or 59.4 Gy in 1.8 Gy fractions, or equivalent or lower doses.
- Patients who have received prior treatment with non-standard RT dose and fractionation, interstitial brachytherapy, stereotactic radiosurgery, etc. are eligible as long as the criterion in 3.1.1 a, b, or c is met or approved by principal investigator.

3.1.3 Patients must have recovered from the toxic effects of prior therapy, and there must be a minimum time of 28 days prior to registration from the administration of any investigational agent or prior cytotoxic therapy with the following exceptions:
- 14 days from administration of vincristine
- 42 days from administration of nitrosoureas
- 21 days from administration of procarbazine

3.1.4 Patients having undergone recent resection of their glioblastoma (within 5 weeks prior to registration) must have recovered from the effects of surgery. For CNS related core or needle biopsies, a minimum of 7 days must have elapsed prior to registration.

Residual disease following resection of recurrent glioblastoma is not mandated for eligibility into the study. To best assess the extent of residual disease post-operatively, a post-operative or intra-operative MRI scan (or CT scan for patients with non-compatible devices) must be performed prior to registration and should be within 96 hours post surgery (although 24 hours would be optimum).

3.1.5 History/physical examination, including neurologic examination, within 14 days prior to registration

3.1.6 Karnofsky performance status ≥ 60 within 14 days prior to registration

3.1.7 Age ≥ 18

3.1.8 CBC/differential obtained within 14 days prior to registration, with adequate bone marrow function. Adequate bone marrow reserve as follows:
- Absolute neutrophil count (ANC) ≥ 1,500 cells/mm³
- Platelets ≥ 75,000 cells/mm³
- Hemoglobin ≥ 9.0 g/dl (Note: The use of transfusion or other intervention to achieve Hgb ≥ 9.0 g/dl is acceptable.)

3.1.9 Acceptable liver (total bilirubin ≤ 2.0 mg/dL, and SGOT or AST ≤ 2.5 times the upper limit of normal) and renal function (serum creatinine ≤ 1.8 mg/dL) within 14 days prior to registration.

- Urine protein: creatinine (UPC) ratio < 1.0 within 14 days prior to registration OR urine dipstick for proteinuria ≤ 2+ (patients discovered to have > 2+ proteinuria on dipstick urinalysis at baseline must have a UPC ratio done that is <1.0 to be eligible. If the UPC ratio is ≥ 1.0 then the patients should undergo a 24-hour urine collection and must demonstrate ≤ 1g of protein in 24 hours to be eligible).

Note: UPC ratio of spot urine is an estimation of the 24-hour urine protein excretion; a UPC ratio of 1 is roughly equivalent to a 24-hour urine protein of 1 gm. UPC ratio is calculated using one of the following formulas:
- [urine protein]/[urine creatinine]: if both protein and creatinine are reported in mg/dL
- [(urine protein) x0.088]/[urine creatinine]: if urine creatinine is reported in mmol/L
3.1.10 Patients must not be pregnant (positive pregnancy test) or breast feeding; pregnancy test must be done within 7 days prior to registration. Effective contraception (men and women) must be used in patients of child-bearing potential while on study treatment and for 6 months after.

3.1.11 Patients on full-dose anticoagulants (e.g., warfarin or LMW heparin) must meet both of the following criteria:
- No active bleeding or pathological condition that carries a high risk of bleeding (e.g., tumor involving major vessels or known varices)
- In-range INR (usually between 2 and 3) on a stable dose of oral anticoagulant or on a stable dose of low molecular weight heparin, within 14 days prior to registration

3.1.12 Patient must be able to provide study-specific informed consent prior to study entry.

3.2 Conditions for Patient Ineligibility (4/15/14)

3.2.1 More than three relapses
3.2.2 Infratentorial, or leptomeningeal evidence of recurrent disease
3.2.3 Recurrent or persistent tumor greater than 6 cm in maximum diameter
3.2.4 Prior therapy with an inhibitor of VEGF or VEGFR (including bevacizumab)
3.2.5 Prior invasive malignancy (except non-melanomatous skin cancer) unless disease free for a minimum of 1 year (for example, carcinoma in situ of the breast, oral cavity, or cervix are all permissible).

3.2.6 Severe, active co-morbidity, defined as follows:
- Unstable angina and/or congestive heart failure requiring hospitalization within the last 6 months prior to registration
- Transmural myocardial infarction within the last 6 months prior to registration
- History of stroke or transient ischemic attack within 6 months prior to registration
- Significant vascular disease (e.g., aortic aneurysm, history of aortic dissection) or clinically significant peripheral vascular disease.
- Acute bacterial or fungal infection requiring intravenous antibiotics at the time of registration
- Chronic Obstructive Pulmonary Disease exacerbation or other respiratory illness requiring hospitalization or precluding study therapy at the time of registration
- Hepatic insufficiency resulting in clinical jaundice and/or coagulation defects; note, however, that laboratory tests for liver function other than screening panel (Section 3.1) and coagulation parameters are not required for entry into this protocol.
- Acquired Immune Deficiency Syndrome (AIDS) based upon current CDC definition; note, however, that HIV testing is not required for entry into this protocol. The need to exclude patients with AIDS from this protocol is necessary because the treatments involved in this protocol may be significantly immunosuppressive. Protocol-specific requirements may also exclude immuno-compromised patients.

3.2.7 Pregnancy or women of childbearing potential and men who are sexually active and not willing/able to use medically acceptable forms of contraception; this exclusion is necessary because the treatment involved in this study may be significantly teratogenic.

3.2.8 Prior allergic reaction to the study drug (Bevacizumab)
3.2.9 Prior history of hypertensive crisis or hypertensive encephalopathy.
3.2.10 History of a non-healing wound, ulcer, or bone fracture within 90 days (3 months) prior to registration
3.2.11 Gastrointestinal bleeding or any other hemorrhage/bleeding event CTCAE, v. 4 grade 3 or greater within 30 days prior to registration
3.2.12 Major surgical procedure, open biopsy, or significant traumatic injury within 28 days prior to registration (with the exception of craniotomy)

4.0 PRETREATMENT EVALUATIONS/MANAGEMENT
NOTE: This section lists baseline evaluations needed before the initiation of protocol treatment that do not affect eligibility.

4.1 Highly Recommended Evaluations (4/15/14)
4.1.1 Baseline MR diffusion and perfusion imaging is optional but strongly recommended as further confirmation that the GTV is related to tumor and not radiation effect. The same type of enhanced
scan, i.e., MRI or CT, should be used throughout the period of protocol treatment for tumor measurement. See also Section 11.1.3.

4.1.2 The MGMT methylation status as a predictor of outcome will be obtained for the following patient groups:

- Patients who have already had MGMT performed prior to registration into an NRG Oncology/RTOG GBM trial collecting MGMT methylation status.
- Patients who have had MGMT analysis performed as routine care by a treating physician outside of an NRG Oncology/RTOG GBM trial.

4.1.3 Pre-operative contrast-enhanced MRI or CT scan.

5.0 REGISTRATION PROCEDURES (10/9/14)

Access requirements for OPEN and TRIAD:

Site staff will need to be registered with CTEP and have a valid and active CTEP-IAM account. The Cancer Therapy Evaluation Program (CTEP) Identity and Access Management (IAM) application is a web-based application intended for use by both Investigators (i.e., all physicians involved in the conduct of NCI-sponsored clinical trials) and Associates (i.e., all staff involved in the conduct of NCI-sponsored clinical trials). Associates will use the CTEP-IAM application to register (both initial registration and annual re-registration) with CTEP and to obtain a user account.

Investigators will use the CTEP-IAM application to obtain a user account only. (See CTEP Investigator Registration Procedures below for information on registering with CTEP as an Investigator, which must be completed before a CTEP-IAM account can be requested.)

An active CTEP-IAM user account will be needed to access all CTEP and CTSU (Cancer Trials Support Unit) websites and applications, including the CTSU members’ website.

Additional information can be found on the CTEP website at <http://ctep.cancer.gov/branches/pmb/associate_registration.htm>. For questions, please contact the CTEP Associate Registration Help Desk by email at <ctepreghelp@ctep.nci.nih.gov>.

Note: As of Amendment 1 activation, this trial is not utilizing the services of the ITC for dosimetry digital treatment data submission. See below for information on installing TRIAD for submission of digital RT data prior to enrolling patients.

5.1 Pre-Registration Requirements for Image-Guided Radiotherapy (IGRT) Treatment Approach (11/20/13)

5.1.1 Institutions that plan to utilize PTV margins of less than 5 mm will also be required to complete image-guided radiotherapy (IGRT) credentialing for brain.

In order to utilize IGRT for margin reduction (see Section 6.3), the center must be credentialed for its use. This means the institution must have met technology requirements and have provided the baseline physics information. This information is available on the NRG Oncology/RTOG website, http://www.rtog.org/ClinicalTrials/ProtocolTable/StudyDetails.aspx?study=1205.

In order to become credentialed for brain IGRT, the institution must have already become credentialed for either 3DCRT and/or IMRT. Institutions that have not been credentialed by NRG Oncology to perform 3DCRT and/or IMRT MUST apply for 3DCRT and/or IMRT credentialing as described below in Sections 5.2 and 5.3.

5.1.2 IGRT Credentialing Process

- IGRT credentialing for brain (review of at least one case) will be required for institutions utilizing PTV margins of less than 5 mm (See Section 6.3). The first step is for the institution or investigator to update or complete a new Facility Questionnaire and/or set up an SFTP account for digital data submission. See Section 12 for details.
Next, the institution must submit a series of daily treatment images along with a spreadsheet of IGRT data from an anonymized brain cancer patient. This information is available on the NRG Oncology/RTOG website, http://www.rtog.org/ClinicalTrials/ProtocolTable/StudyDetails.aspx?study=1205. This series must include a minimum of 5 daily pre-treatment images obtained on sequential treatment days. Pre-treatment images may include three-dimensional (3D) volumetric images (either fan- or cone-beam CT with Megavoltage (MV) or kilovoltage (kV) x-ray or Orthogonal (MV or kV) 2D images. These images and the spreadsheet will be reviewed by the Study Chair, Christina Tsien, MD, and the Medical Physics Co-chair, Martha Matuszak, PhD, prior to certification.

5.2 Pre-Registration Requirements for IMRT Treatment Approach (2/27/14)

5.2.1 In order to utilize IMRT on this study (this includes all CyberKnife treatments), the institution must have met specific technology requirements and have provided baseline physics information. Instructions for completing these requirements or determining if they already have been met are available on the IROC Houston [formerly the Radiological Physics Center (RPC) web site]. Visit http://irochouston.mdanderson.org and select “Credentialing” and “Credentialing Status Inquiry”.

An IMRT phantom study with the IROC Houston must be successfully completed (if the institution has not previously met this IMRT credentialing requirement). Instructions for requesting and irradiating the phantom are available on the IROC Houston web site at http://irochouston.mdanderson.org; select “Credentialing” and “RTOG”. Upon review and successful completion of the phantom irradiation, IROC Houston will notify both the registering institution and NRG Oncology that the institution has completed this requirement. Subsequently, NRG Oncology will update the RSS database.

5.2.2 The institution or investigator must update or complete the electronic Facility Questionnaire (available on the IROC Houston web site at http://irochouston.mdanderson.org ) and then complete a credentialing status inquiry form, also found on the IROC Houston, web site to determine if your site has met all of the requirements. This will be completed in place of updating the previous Facility Questionnaire. When the requirements are met, the site and NRG Oncology will be notified. NRG Oncology will then update the RSS database. Before any cases can be entered, a TRIAD account must also have been set up for data submission.

5.3 Pre-Registration Requirements for 3D-CRT Treatment Approach (2/27/14)

5.3.1 Only institutions that have met the technology requirements and that have provided the baseline physics information that are described in 3D-CRT Quality Assurance Guidelines may enter patients onto this study.

5.3.2 The institution or investigator must update or complete a Facility Questionnaire (available on the RPC web site at http://irochouston.mdanderson.org ) and complete a credentialing status inquiry form also found on the IROC Houston web site to determine if your site has met all of the requirements. This will be completed in place of updating the previous Facility Questionnaire. When the requirements are met the site and NRG Oncology will be notified. NRG Oncology will then update the RSS database prior to entering any cases. A TRIAD account must also have been set up for data submission prior to submitting any data. IROC Houston will notify the institution and NRG Oncology when all requirements have been met and the institution is eligible to enter patients onto this study. NRG Oncology will update the RSS database.

5.4 Pre-Registration Requirements for Proton Treatment Approach (2/27/14)

5.4.1 Proton Credentialing Process

Proton therapy may be used on this protocol. Investigators using proton therapy must comply with the NCI proton guidelines for the Use of Proton Radiation Therapy in NCI Sponsored Cooperative Group Clinical Trials, which are available on the websites of the IROC Houston (http://irochouston.mdanderson.org), ATC (http://atc.wustl.edu), and QARC (http://www.qarc.org). These requirements include, but are not limited to, completion of a proton facility questionnaire, a successful IROC Houston site visit, which identifies the proton technique(s) which can be used, annual monitoring of the proton beam calibration, e.g. IROC Houston’s monitoring program.
5.4.2 Dose will be reported in Gy (RBE), where 1 Gy(RBE) = proton dose Gy x RBE (radiobiological effective dose), RBE = 1.1.

5.4.3 Radiation doses shall be prescribed using the protocol specified definitions for GTV and CTV. For set-up uncertainties and target motion, additional margin (including proximal and distal), smearing, and range of modulation will be added on a per beam basis. Proton treatment plans will be based upon a CT scanner for which the institution has defined an imaging protocol for protons which establishes the relationship between the CT number and the stopping power ratios.

5.4.4 The IROC Houston will coordinate the completion of the proton therapy use approval process in conjunction with the appropriate other Quality Assurance Offices for any additional protocol specific credentialing requirements. IROC Houston will notify the institution and NRG Oncology when all requirements have been met and the institution is eligible to enter patients onto this study. NRG Oncology will update the RSS database.

5.4.5 Additional credentialing requirements for this protocol may be found on the IROC Houston web site (http://irochouston.mdanderson.org) by selecting “Credentialing” and “RTOG”.

5.4.6 Proton resources for this protocol include:
Michael T. Gillin, PhD
Professor
The University of Texas
MD Anderson Cancer Center
Department of Radiation Physics
713-563-2507/Fax: 713-563-2545
mgillin@mdanderson.org

Anita Mahajan, MD
University of Texas MD Anderson Cancer Center
1515 Holcombe Boulevard
Houston, TX 77030
713-563-2350
amahajan@mdanderson.org

5.4.7 If protons are to be used, review and successful completion of the “Dry-Run” QA test using protons is required, the IROC Houston will notify both the registering institution and NRG Oncology that the institution has successfully completed this requirement for protons.

There are no proton protocol specific credentialing requirements for this protocol.

5.5 Digital RT Data Submission Using TRIAD (11/20/13)
TRIAD is the American College of Radiology’s (ACR) image exchange application. TRIAD provides sites participating in RTOG clinical trials a secure method to transmit DICOM RT and other objects. TRIAD anonymizes and validates the images as they are transferred.

TRIAD Access Requirements
- Site physics staff who will submit images through TRIAD will need to be registered with The Cancer Therapy Evaluation Program (CTEP) and have a valid and active CTEP Identity and Access Management (IAM) account. Please refer to Section 5.0 of the protocol for instructions on how to request a CTEP-IAM account.
- To submit images, the site physics user must have been assigned the 'TRIAD site user’ role on the relevant Group or CTSU roster.
- RAs are able to submit standard of care imaging through the same method.
TRIAD Installations
When a user applies for a CTEP-IAM account with proper user role, he/she will need to have the TRIAD application installed on his/her workstation to be able to submit images. TRIAD installation documentation can be found on the NRG Oncology/RTOG website Core lab tab.

This process can be done in parallel to obtaining your CTEP IAM account username and password.

If you have any questions regarding this information, please send an email to the TRIAD Support mailbox at TRIAD-Support@acr.org.

5.6 Regulatory Pre-Registration Requirements (10/9/14)

Investigator Registration Requirements

Prior to the recruitment of a patient for this study, investigators must be registered members of a Lead Protocol Organization. Food and Drug Administration (FDA) regulations and National Cancer Institute (NCI) policy require all investigators participating in any NCI-sponsored clinical trial to register and to renew their registration annually. Registration requires the submission of:

- a completed **Statement of Investigator Form** (FDA Form 1572) with an original signature
- a current Curriculum Vitae (CV)
- a completed and signed **Supplemental Investigator Data Form** (IDF)
- a completed **Financial Disclosure Form** (FDF) with an original signature

Fillable PDF forms and additional information can be found on the CTEP website at <http://ctep.cancer.gov/investigatorResources/investigator_registration.htm>. For questions, please contact the CTEP Investigator Registration Help Desk by email at <pmbregpend@ctep.nci.nih.gov>.

Site Registration Requirements [Insert as appropriate]

This study is supported by the NCI Cancer Trials Support Unit (CTSU).

IRB Approval

Each investigator or group of investigators at a clinical site must obtain IRB approval for this protocol and submit IRB approval and supporting documentation to the CTSU Regulatory Office before they can be approved to enroll patients. Study centers can check the status of their registration packets by querying the Regulatory Support System (RSS) site registration status page of the CTSU members’ website by entering credentials at https://www.ctsu.org.

Downloading Site Registration Documents:

Site registration forms may be downloaded from the **RTOG 1205** protocol page located on the CTSU members’ website. Permission to view and download this protocol and its supporting documents is restricted and is based on person and site roster assignment housed in the CTSU RSS.

- Go to https://www.ctsu.org and log in to the members’ area using your CTEP-IAM username and password
- Click on the Protocols tab in the upper left of your screen
- Click on the **NRG Oncology** link to expand, then select trial protocol #RTOG-1205.
- Click on the Site Registration Documents link

Requirements RTOG 1205 Site Registration:

- CTSU IRB Certification CTSU IRB/Regulatory Approval Transmittal Sheet
- IRB Approval Letter
- IRB/REB Approved Informed Consent (English and native language versions*) *Note: Institutions must provide certification/verification of IRB/REB consent translation to NRG
Headquarters (described below).

- IRB/REB registration number renewal information as appropriate.
- CTSU RT Facilities Inventory Form

NOTE: Per NCI policy all institutions that participate on protocols with a radiation therapy component must participate in the Imaging and Radiation Oncology Core (IROC) monitoring program. If this form has been previously submitted to CTSU it does not need to be resubmitted unless updates have occurred at the RT facility.

**Submitting Regulatory Documents:**
Submit completed forms along with a copy of your IRB Approval and Informed Consent to the CTSU Regulatory Office, where they will be entered and tracked in the CTSU RSS.

CTSU Regulatory Office
1818 Market Street, Suite 1100
Philadelphia, PA 19103
Phone: 1-866-651-2878
Fax: 215-569-0206
E-mail: CTSURegulatory@ctsu.coccg.org (for regulatory document submission only)

**Checking Your Site’s Registration Status:**
Check the status of your site’s registration packets by querying the RSS site registration status page of the members’ section of the CTSU website. (Note: Sites will not receive formal notification of regulatory approval from the CTSU Regulatory Office.)

- Go to https://www.ctsu.org and log in to the members’ area using your CTEP-IAM username and password
- Click on the Regulatory tab at the top of your screen
- Click on the Site Registration tab
- Enter your 5-character CTEP Institution Code and click on Go

**Non-English Speaking Canadian and Non-North American Institutions**
Translation of documents is critical. The institution is responsible for all translation costs. All regulatory documents, including the IRB/REB approved consent, must be provided in English and in the native language. Certification of the translation is optimal but due to the prohibitive costs involved NRG Oncology will accept, at a minimum, a verified translation. A verified translation consists of the actual REB approved consent document in English and in the native language, along with a cover letter on organizational/letterhead stationery that includes the professional title, credentials, and signature of the translator as well as signed documentation of the review and verification of the translation by a neutral third party. The professional title and credentials of the neutral third party translator must be specified as well.

5.6.3 Pre-Registration Requirements FOR CANADIAN INSTITUTIONS
Prior to clinical trial commencement, Canadian institutions must complete and fax (215-569-0206) or e-mail (CTSURegulatory@ctsu.coccg.org) the following Health Canada forms to the CTSU Regulatory Office:
- Health Canada’s Therapeutic Products Directorates’ Clinical Trial Site Information Form,
- Qualified Investigator Undertaking Form, and
- Research Ethics Board Attestation Form.

5.6.4 Pre-Registration Requirements FOR INTERNATIONAL INSTITUTIONS
- **For institutions that do not have an approved LOI for this protocol:**
  International sites must submit an LOI to NRG Oncology to receive approval to participate in this trial. For more details see link below: http://www.rtog.org/Researchers/InternationalMembers/LetterofIntent.aspx.
- **For institutions that have an approved LOI for this protocol:**
  All requirements indicated in your LOI Approval Notification must be fulfilled prior to enrolling patients to this study.
5.7 Registration (10/9/14)

5.7.1 OPEN Registration Instructions

Registration can occur only after evaluation for eligibility is complete, eligibility criteria have been met, and the study site is listed as ‘approved’ in the CTSU RSS. Patients must have signed and dated all applicable consents and authorization forms.

Patient enrollment will be facilitated using the Oncology Patient Enrollment Network (OPEN). OPEN is a web-based registration system available on a 24/7 basis. To access OPEN, the site user must have an active CTEP-IAM account (check at <https://eapps-ctep.nci.nih.gov/iam/index.jsp>) and a ‘Registrar’ role on either the LPO or participating organization roster. All site staff will use OPEN to enroll patients to this study. OPEN can be accessed at https://open.ctsu.org or from the OPEN tab on the CTSU members’ web site https://www.ctsu.org.

Prior to accessing OPEN site staff should verify the following:

- All eligibility criteria have been met within the protocol stated timeframes. Site staff should use the registration forms provided on the group or CTSU web site as a tool to verify eligibility.
- All patients have signed an appropriate consent form and HIPAA authorization form (if applicable).

Further instructional information is provided on the OPEN tab of the CTSU members’ side of the CTSU website at https://www.ctsu.org or at https://open.ctsu.org. For any additional questions contact the CTSU Help Desk at 1-888-823-5923 or ctsucontact@westat.com.

5.7.2 In the event that the OPEN system is not accessible, participating sites can contact web support for assistance with web registration: websupport@acr.org or call the Registration Desk at (215) 574-3191, Monday through Friday, 8:30 a.m. to 5:00 p.m. ET. The registrar will ask the site to fax in the eligibility checklist and will need the registering individual’s e-mail address and/or return fax number. This information is required to assure that mechanisms usually triggered by the OPEN web registration system (e.g. drug shipment and patient-specific calendar) will occur.

6.0 RADIATION THERAPY (11/20/13)

Note: Intensity Modulated RT (IMRT) Is Allowed.

Protons are permitted for institutions which have been approved and credentialled for protons, as protons may reduce the volume of normal tissue which will be re-irradiated. (If protons are used, to avoid delays resulting from unplanned equipment availability, photon therapy may be administered instead of proton therapy.)

Note: As of Amendment 1 activation, this trial is not utilizing the services of the ITC for dosimetry digital treatment data submission. See Section 5 for information on installing TRIAD for submission of digital RT data PRIOR to enrolling patients.

6.1 Dose Specifications

6.1.1 Photons: Treatment shall consist of 35 Gy delivered in 10 fractions. Target coverage and homogeneity limits and deviations are listed in Table 1.

6.1.2 Protons - Absorbed dose: Doses are expressed in units of RBE-weighted absorbed dose, $D_{RBE}$. For protons the RBE is taken to be 1.1. $D_{RBE} = 1.1 \times D$, where D represents the absorbed dose in Gy. Treatment shall consist of 35 Gy(RBE) delivered in 10 fractions. Target coverage and homogeneity limits and deviations are listed in Table 1.

Table 1. Target Coverage and Dose Limits

<table>
<thead>
<tr>
<th>Dose Metric</th>
<th>Per Protocol</th>
<th>Variation Acceptable</th>
<th>Deviation Unacceptable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume of PTV covered by the prescription dose</td>
<td>Greater than or equal to 95% of the PTV</td>
<td>Greater than or equal to 90% of the PTV</td>
<td>Less than 90% of the PTV receiving greater</td>
</tr>
</tbody>
</table>
photons 35 Gy – protons 35 Gy(RBE) should receive greater than or equal to photons 35 Gy – protons 35 Gy(RBE) receiving greater than or equal to photons 35 Gy – protons 35 Gy(RBE) than or equal to photons 35 Gy – protons 35 Gy(RBE)

Minimum dose to the PTV (0.03 cc) Greater than or equal to 29.75 Gy (85% of the prescription dose) – protons 29.75 Gy(RBE) Greater than or equal to 28 Gy (80% of the prescription dose) – protons 28 Gy(RBE); Minimum doses of less than 28 Gy are acceptable if they occur due to OAR/PTV overlap Less than 28 Gy (80% of the prescription dose) – protons 28 Gy(RBE); Minimum doses of less than 28 Gy are unacceptable unless they occur in regions of OAR/PTV overlap

Maximum dose to the PTV (0.03 cc) Less than or equal to 42 Gy (120% Rx Dose) – protons 42 Gy(RBE) Less than or equal to 45.50 Gy (130% Rx Dose) – protons 45.50 Gy(RBE) Greater than 45.50 Gy (130% Rx Dose) – protons 45.50 Gy(RBE)

6.2 Technical Factors [Equipment, energies]
The 10 treatment fractions of 3.5 Gy each will be delivered on consecutive treatment days (typically 5 fractions per week). Any FDA cleared external beam radiation delivery system may be used (including conventional linear accelerators, cyberknife systems, tomotherapy, proton therapy, etc.). Imaging for treatment planning will be obtained with the patient in the same position and immobilization device as for treatment. All patients will be positioned via a combination of rigid immobilization and daily image guidance to ensure positioning accuracy of 3 mm or better, and of a magnitude that justifies the PTV margin applied (the participating institutions must document the immobilization and localization methods applied).

6.3 Localization, Simulation, and Immobilization (10/9/14)
An MRI and/or CT scanning obtained with the patient immobilized in the treatment position is required for treatment planning. The image resolution of no worse than 1.5 mm x 1.5 mm x 3 mm. Immobilization must be rigid (e.g. thermoplastic masks). For daily treatment, localization will include the steps of a) immobilization with the same device used for simulation, and b) daily image guidance using at a minimum orthogonal pairs of radiographs aligned to DRRs as a computer-assisted process (CT-CBCT alignment is permitted as well). Institutions utilizing PTV margins of less than 5 mm are required to undergo IGRT credentialing for brain (see Section 5.1).

6.4 Treatment Planning/Target Volumes (10/9/14)
A GTV will be defined using contrast-enhanced CT and/or MRI images. The post-operative resection cavity will be outlined if no residual enhancing tumor is noted. A CTV expansion of no more than 5 mm is optional for lesions measuring less than 3.5 cm in maximum diameter or if this is a new lesion, but must be reported when used. Otherwise, no additional CTV expansion will be added. A PTV expansion that is justified based on image guidance and immobilization will be applied. Regardless of immobilization and localization methods, the PTV expansion should be no smaller than 3 mm. As noted in Section 6.3, institutions utilizing PTV margins of less than 5 mm are required to undergo IGRT credentialing for brain (see Section 5.1) and utilize computer-assisted daily IGRT for all treatment fractions.

If protons are used, an adjustment must be made within the treatment planning process to take into account of range uncertainties along the beam direction, following the established practice at the specific proton facility, which should be based on the recommendations contained in ICRU 78, paragraph 5.1.4.4.

Treatment planning using multiple, non-coplanar beams or arc-based therapy is advised. IMRT based planning is allowed. To ensure dose calculation accuracy, the minimum field size used should be consistent with the minimum field size commissioned for use at the institution and
should not be smaller than 2 cm x 2 cm. In any case, the objective of treatment planning is to ensure sufficient dose conformity that the normal tissue constraints are met.

6.5 Critical Structures (2/27/14)
Normal tissues to be contoured will include the brain, brainstem, optic nerves and chiasm. Planning risk volume (PRV) expansions (minimum of 3 mm) should be utilized for optic nerves and chiasm. Special consideration should be given to avoid doses greater than the prescription dose within the scalp as well as limiting the exit dose through the oral cavity and mucosa. The treatment parameters should be modified to optimize the conformity of the prescription isodose volume to the target volume while minimizing dose to critical structures. There are two scenarios for normal tissues limits: (1) previous radiation to the local area including critical organs at risk and (2) no previous radiation to the local area or organs at risk. The limits for both scenarios are given in Table 2.

Table 2. Normal Tissue Dose Limits

### 6.6 Documentation Requirements
At the completion of treatment, the following should be forwarded to NRG Oncology: daily treatment record and the radiotherapy summary per Section 12.1. In addition, CT/MRI documentation must be submitted per Section 12.2. Isodose distributions should be displayed on orthogonal planes or, if not possible, on multiple transverse slices through each target.

### 6.7 Compliance Criteria
See Tables 1 and 2 for target and normal tissue compliance criteria.

### 6.8 R.T. Quality Assurance Reviews
The Radiation Oncology Co-Chair, Christina Tsien, M.D., will perform an RT Quality Assurance Review of cases on an ongoing basis. The final cases will be reviewed within 6 months after this study has reached the target accrual or as soon as complete data for all cases enrolled has been received at Imaging and Radiation Oncology Core (IROC) Philadelphia, whichever occurs first. These reviews will be ongoing and performed at the NRG Oncology semi-annual meetings as well as at IROC Philadelphia.

### 6.9 Radiation Therapy Adverse Events

#### 6.9.1 Acute
Expected acute radiation-induced toxicities include hair loss, fatigue, and erythema or soreness of the scalp. Potential acute toxicities include nausea and vomiting as well as temporary aggravation of brain tumor symptoms such as headaches, seizures, and weakness. Reactions in the ear canals and on the ear should be observed and treated symptomatically; these reactions could result in short-term hearing impairment. Dry mouth or altered taste have been occasionally reported.

#### 6.9.2 Early Delayed
Possible early delayed radiation effects include lethargy and transient worsening of existing neurological deficits occurring 1-3 months after radiotherapy treatment.

#### 6.9.3 Late Delayed
Possible late delayed effects of radiotherapy include risk of radiation necrosis, and endocrine dysfunction. In addition, neurocognitive deficits, which could lead to mental slowing and behavioral change, are possible. Permanent hearing impairment and visual damage are rare. Cataracts can be encountered.

### 6.10 Radiation Therapy Adverse Event Reporting
See Section 7.6.

### 7.0 DRUG THERAPY
Protocol treatment must begin within 14 days after registration.
7.1 Treatment (10/9/14)

7.1.1 Dose Definition
Bevacizumab will be administered at a dose of 10 mg/kg every 2 weeks. The patient’s weight must be checked prior to each dose of bevacizumab. Doses will be adjusted if there is a > 10% change in weight.

7.1.2 Technique of Administration
Bevacizumab will be administered intravenously per institutional guidelines with associated pre-medications.

7.1.3 Duration of Treatment
Initial cycle of bevacizumab must start within 14 days of registration. A deviation of +/- 3 days is permitted. If beyond this timing period, the imaging and work-up will need to be repeated. Subsequent bevacizumab doses may be given every 14 days apart +/- 3 days due to holidays, etc. Treatment may be held for > grade 3 toxicities as defined in Section 7.3.

Arm 1: Patients randomized to the bevacizumab alone arm will be administered bevacizumab every 2 weeks until disease progression.

Arm 2: Patients randomized to the bevacizumab and re-irradiation arm will receive an initial induction dose of bevacizumab (alone without radiation). It will then be followed by concurrent bevacizumab and radiation at the next dose which is administered 14 days later. This will allow additional time for radiation therapy planning especially in symptomatic patients. Concurrent bevacizumab cycle may be given either on the day prior to start of radiation or on day 1 of radiation. Bevacizumab will then be continued every 2 weeks until disease progression.

7.2 Bevacizumab Agent Information (6/23/14)
Consult the package insert for detailed pharmacologic and safety information.

7.2.1 Description and Packaging
Bevacizumab is a humanized IgG1 monoclonal antibody (MAb) that binds all biologically active isoforms of human VEGF (or VEGF-A) with high affinity (kd = 1.1 nM). The antibody consists of a human IgG1 framework and the antigen-binding complementarity-determining regions from the murine anti-VEGF MAb A.4.6.1.16-18. Vials contain bevacizumab with phosphate, trehalose, polysorbate 20, and sterile water for injection (SWFI), USP.

7.2.2 Administration
Bevacizumab should be administered as a continuous intravenous infusion using a rate-regulating device per institutional guidelines with associated pre-medications. Do not administer as an IV push or bolus. If no institutional guidelines exist, follow below:

Administer the initial dose over a minimum of 90 minutes. If no adverse reactions occur, administer the second dose over a minimum of 60 minutes. If no adverse reactions occur after the second dose, administer subsequent doses over a minimum of 30 minutes. If infusion-related adverse reactions occur, all subsequent infusions should be administered over the shortest period that was well tolerated.

7.2.3 Storage
Vials contain no preservative and are suitable for single use only.

7.2.4 Supply
Commercially available.

- Non-Canadian International Institutions
  Please refer to your LOI Approval Notification. Your institution will be responsible for acquiring any drug noted in the protocol as commercially available and not provided for the study.

7.2.5 Adverse Events
Comprehensive Adverse Events and Potential Risks list (CAEPR) For Bevacizumab (rhuMAb VEGF, NSC 704865)
The Comprehensive Adverse Event and Potential Risks list (CAEPR) provides a single list of reported and/or potential adverse events (AE) associated with an agent using a uniform presentation of events by body system. In addition to the comprehensive list, a subset, the Specific Protocol Exceptions to Expedited Reporting (SPEER), appears in a separate column and is identified with bold and italicized text. This subset of AEs (SPEER) is a list of events that are protocol specific exceptions to expedited reporting to NCI (except as noted below). Refer to the ‘CTEP, NCI Guidelines: Adverse Event Reporting Requirements’ [link to NCI guidelines] for further clarification. Frequency is provided based on 3540 patients. Below is the CAEPR for bevacizumab (rhuMAb VEGF).

**NOTE**: Report AEs on the SPEER **ONLY IF** they exceed the grade noted in parentheses next to the AE in the SPEER. If this CAEPR is part of a combination protocol using multiple investigational agents and has an AE listed on different SPEERs, use the lower of the grades to determine if expedited reporting is required.

- Vascular disorders – Other (arterial thromboembolic event)

---

1. This table will be updated as the toxicity profile of the agent is revised. Updates will be distributed to all Principal Investigators at the time of revision. The current version can be obtained by contacting PIO@CTEP.NCI.NIH.GOV. Your name, the name of the investigator, the protocol and the agent should be included in the e-mail.
The risks of arterial thrombosis such as cardiac or CNS ischemia are increased in elderly patients and in patients with a history of diabetes.

Supraventricular arrhythmias may include supraventricular tachycardia, atrial fibrillation and atrial flutter.

Gastrointestinal fistula may include: Anal fistula, Colonic fistula, Duodenal fistula, Esophageal fistula, Gastric fistula, Gastrointestinal fistula, Rectal fistula, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Gastrointestinal hemorrhage may include: Colonic hemorrhage, Duodenal hemorrhage, Esophageal hemorrhage, Esophageal variceal hemorrhage, Gastric hemorrhage, Hemorrhoidal hemorrhage, Intra-abdominal hemorrhage, Oral hemorrhage, Rectal hemorrhage, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Gastrointestinal obstruction may include: Colonic obstruction, Duodenal obstruction, Esophageal obstruction, Ileal obstruction, Jejunal obstruction, Rectal obstruction, Small intestinal obstruction, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Gastrointestinal perforation may include: Colonic perforation, Duodenal perforation, Esophageal perforation, Gastric perforation, Jejunal perforation, Rectal perforation, Small intestinal perforation, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Gastrointestinal ulcer may include: Duodenal ulcer, Esophageal ulcer, Gastric ulcer, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Infection may include any of the 75 infection sites under the INFECTIONS AND INFESTATIONS SOC.

Anastomotic leak may include: Gastric anastomotic leak; Gastrointestinal anastomotic leak; Large intestinal anastomotic leak; Rectal anastomotic leak; Small intestinal anastomotic leak; Urostomy leak; Vaginal anastomotic leak

Metaphyseal dysplasia was observed in young patients who still have active epiphyseal growth plates.

Cases of osteonecrosis of the jaw (ONJ) have been reported in cancer patients in association with bevacizumab treatment, the majority of whom had received prior or concomitant treatment with i.v. bisphosphonates.

Increased rate of peripheral sensory neuropathy has been observed in trials combining bevacizumab and chemotherapy compared to chemotherapy alone.

Ovarian failure, defined as amenorrhea lasting 3 or more months with follicle-stimulating hormone (FSH) elevation (≥30 mIU/mL), was increased in patients receiving adjuvant bevacizumab plus mFOLFOX compared to mFOLFOX alone (34% vs. 2%). After discontinuation of bevacizumab, resumption of menses and an FSH level <30 mIU/mL was demonstrated in 22% (7/32) of these women. Long term effects of bevacizumab exposure on fertility are unknown.

Arterial thromboembolic event includes visceral arterial ischemia, peripheral arterial ischemia, heart attack and stroke.

Also - This table will be updated as the toxicity profile of the agent is revised. Updates will be distributed to all Principal Investigators at the time of revision. The current version can be obtained by contacting PIO@CTEP.NCI.NIH.GOV. Your name, the name of the investigator, the protocol and the agent should be included in the e-mail.
The risks of arterial thrombosis such as cardiac or CNS ischemia are increased in elderly patients and in patients with a history of diabetes.

Supraventricular arrhythmias may include supraventricular tachycardia, atrial fibrillation, and atrial flutter.

Gastrointestinal fistula may include: Anal fistula, Colonic fistula, Duodenal fistula, Esophageal fistula, Gastric fistula, Gastrointestinal fistula, Rectal fistula, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Gastrointestinal hemorrhage may include: Colonic hemorrhage, Duodenal hemorrhage, Esophageal hemorrhage, Esophageal varices hemorrhage, Gastric hemorrhage, Hemorrhoidal hemorrhage, Intra-abdominal hemorrhage, Oral hemorrhage, Rectal hemorrhage, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Gastrointestinal obstruction may include: Colonic obstruction, Duodenal obstruction, Esophageal obstruction, Ileal obstruction, Jejunal obstruction, Rectal obstruction, Small intestinal obstruction, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Gastrointestinal perforation may include: Colonic perforation, Duodenal perforation, Esophageal perforation, Gastric perforation, Jejunal perforation, Rectal perforation, and Small intestinal perforation.

Gastrointestinal ulcer may include: Duodenal ulcer, Esophageal ulcer, Gastric ulcer, and other sites under the GASTROINTESTINAL DISORDERS SOC.

Infection may include any of the 75 infection sites under the INFECTIONS AND INFESTATIONS SOC.

Anastomotic leak may include Gastric anastomotic leak; Gastrointestinal anastomotic leak; Large intestinal anastomotic leak; Rectal anastomotic leak; Small intestinal anastomotic leak; Urostomy leak; Vaginal anastomotic leak.

There have been reports of non-mandibular osteonecrosis (avascular necrosis) in patients under the age of 18 treated with bevacizumab.

Metaphyseal dysplasia was observed in young patients who still have active epiphyseal growth plates.

Cases of osteonecrosis of the jaw (ONJ) have been reported in cancer patients in association with bevacizumab treatment, the majority of whom had received prior or concomitant treatment with i.v. bisphosphonates.

Increased rate of peripheral sensory neuropathy has been observed in trials combining bevacizumab and chemotherapy compared to chemotherapy alone.

Ovarian failure, defined as amenorrhea lasting 3 or more months with follicle-stimulating hormone (FSH) elevation (≥30 mIU/mL), was increased in patients receiving adjuvant bevacizumab plus mFOLFOX compared to mFOLFOX alone (34% vs. 2%). After discontinuation of bevacizumab, resumption of menses and an FSH level <30 mIU/mL was demonstrated in 22% (7/32) of these women. Long term effects of bevacizumab exposure on fertility are unknown.

Arterial thromboembolic event includes visceral arterial ischemia, peripheral arterial ischemia, heart attack, and stroke.

Adverse events reported on bevacizumab (rhuMAb VEGF) trials, but with the relationship for which there is insufficient evidence to suggest that there was a reasonable possibility that bevacizumab (rhuMAb VEGF) still undetermined caused the adverse event:
BLOOD AND LYMPHATIC SYSTEM DISORDERS - Blood and lymphatic system disorders - Other (idiopathic thrombocytopenia purpura); Bone marrow hypocellular; Disseminated intravascular coagulation; Hemolysis
CARDIAC DISORDERS - Atrioventricular block complete; Atrioventricular block first degree; Cardiac arrest; Myocarditis; Pericardial effusion; Restrictive cardiomyopathy; Right ventricular dysfunction
EAR AND LABYRINTH DISORDERS - Ear and labyrinth disorders - Other (tympanic membrane perforation); Hearing impaired; Tinnitus; Vertigo
ENDOCRINE DISORDERS - Hyperthyroidism; Hypothyroidism
EYE DISORDERS - Blurred vision; Cataract; Dry eye; Extraocular muscle paresis; Eye disorders - Other (blindness); Eye disorders - Other (conjunctival hemorrhage); Eye disorders - Other (corneal epithelial defect); Eye disorders - Other (floaters); Eye disorders - Other (ischemic CRVO); Eye disorders - Other (macular pucker); Eye disorders - Other (transient increased IOP > or =30 mm Hg); Eye disorders - Other (vitreous hemorrhage); Eye pain; Keratitis; Optic nerve disorder; Photophobia; Retinal detachment; Retinal tear; Retinopathy; Watering eyes
GASTROINTESTINAL DISORDERS - Ascites; Chelitis; Colonic stenosis; Dry mouth; Dysphagia; Enterocolitis; Esophageal pain; Esophageal stenosis; Flatulence; Gastrointestinal disorders - Other (peritonitis); Oral pain; Pancreatitis; Proctitis; Rectal mucositis; Rectal stenosis; Typhilitis
GENERAL DISORDERS AND ADMINISTRATION SITE CONDITIONS - Death NOS; Edema face; Edema limbs; Edema trunk; Facial pain; Fever; Flu like symptoms; Gait disturbance; Injection site reaction; Localized edema; Multi-organ failure; Sudden death NOS
HEPATOBILIARY DISORDERS - Cholecystitis; Gallbladder necrosis; Gallbladder obstruction; Hepatic failure; Hepatic necrosis
INFECTIONS AND INFESTATIONS - Infections and infestations - Other (aseptic meningitis)
INJURY, POISONING AND PROCEDURAL COMPLICATIONS - Arterial injury; Bruising; Burn; Dermatitis radiation; Fracture
INVESTIGATIONS - Activated partial thromboplastin time prolonged; Blood antidiuretic hormone abnormal; CD4 lymphocytes decreased; CPK increased; Carbon monoxide diffusing capacity decreased; Electrocardiogram QT corrected interval prolonged; Forced expiratory volume decreased; GGT increased; INR increased; Lipase increased; Lymphocyte count decreased; Serum amylase increased; Weight gain
METABOLISM AND NUTRITION DISORDERS - Acidosis; Hypercalcemia; Hyperglycemia; Hyperkalemia; Hypermagnesemia; Hypomagnesemia; Hypernatremia; Hypertriglyceridemia; Hyperuricemia; Hypoalbuminemia; Hypocalcemia; Hypoglycemia; Hypermagnesemia; Hypokalemia; Hypothermia; Hypophosphatemia
MUSCULOSKELETAL AND CONNECTIVE TISSUE DISORDERS - Arthritis; Back pain; Bone pain; Chest wall pain; Fibrosis deep connective tissue; Generalized muscle weakness; Head soft tissue necrosis; Joint effusion; Muscle weakness lower limb; Muscle weakness upper limb; Musculoskeletal and connective tissue disorder - Other (aseptic necrotic bone); Musculoskeletal and connective tissue disorder - Other (myasthenia gravis); Musculoskeletal and connective tissue disorder - Other (polymyalgia rheumatica); Neck pain; Pain in extremity; Pelvic soft tissue necrosis; Soft tissue necrosis lower limb
NEOPLASMS BENIGN, MALIGNANT AND UNSPECIFIED (INCL CYSTS AND POLYPS) - Tumor pain
NERVOUS SYSTEM DISORDERS - Arachnoiditis; Ataxia; Central nervous system necrosis; Cerebrospinal fluid leakage; Cognitive disturbance; Depressed level of consciousness; Dysesthesia; Dysgeusia; Dysphasia; Eencephalopathy; Extrapyramidal disorder; Facial nerve disorder; Hydrocephalus; Leukoencephalopathy; Memory impairment; Nervous system disorders - Other (increased intracranial pressure); Paresthesia; Peripheral motor neuropathy; Pyramidal tract syndrome; Seizure; Somnolence; Tremor; Vasovagal reaction
PSYCHIATRIC DISORDERS - Agitation; Anxiety; Confusion; Depression; Insomnia; Libido decreased; Psychosis
REPRODUCTIVE SYSTEM AND BREAST DISORDERS - Breast pain; Erectile dysfunction; Irregular menstruation; Pelvic pain; Vaginal discharge
RESPIRATORY, THORACIC AND MEDIASTINAL DISORDERS - Adult respiratory distress syndrome; Atelectasis; Hypoxia; Nasal congestion; Pulmonary fibrosis; Pulmonary hypertension; Respiratory failure;
Respiratory, thoracic and mediastinal disorders - Other (dry nares); Respiratory, thoracic and mediastinal disorders - Other (pulmonary infarction)

SKIN AND SUBCUTANEOUS TISSUE DISORDERS - Alopecia; Dry skin; Hyperhidrosis; Nail loss; Pain of skin; Palmar-plantar erythrodysesthesia syndrome; Photosensitivity; Purpura; Rash acneiform; Skin and subcutaneous tissue disorders - Other (diabetic foot ulcer); Skin and subcutaneous tissue disorders - Other (skin breakdown/ decubitus ulcer); Skin hyperpigmentation; Skin induration; Skin ulceration; Stevens-Johnson syndrome

VASCULAR DISORDERS - Flushing; Hot flashes; Hypotension; Lymphocele; Phlebitis; Vasculitis

Note: Bevacizumab (rhuMAb VEGF) in combination with other agents could cause an exacerbation of any adverse event currently known to be caused by the other agent, or the combination may result in events never previously associated with either agent.

7.3 Bevacizumab Dose Modifications (8/24/15)
7.3.1 First dose: The dose of bevacizumab will be 10 mg/kg delivered intravenously. There will be no dose reduction for bevacizumab. Treatment should be interrupted or discontinued for certain adverse events, as described below. If bevacizumab is interrupted for ANY reason for > 8 weeks, the patient should discontinue bevacizumab therapy on protocol.

### Treatment Modification for Bevacizumab-Related Adverse Events

</table>

### Hypertension*  
(Treat with antihypertensive medication as needed. The goal of BP control should be consistent with general medical practice)

| Grade 1 | Consider increased BP monitoring |
| Grade 2 asymptomatic | Begin anti-hypertensive therapy and continue bevacizumab |
| Grade 2 symptomatic or Grade 3 | Hold bevacizumab until symptoms resolve **AND** BP < 160/100 mmHg |
| Grade 4 | Discontinue bevacizumab |

### Congestive Heart Failure

| Grade 3 | Discontinue bevacizumab |
| Grade 4 | Discontinue bevacizumab |

### Proteinuria  
(Proteinuria should be monitored by urine dipstick or urine protein creatinine (UPC) ratio before every dose of bevacizumab, if dip is > 2+ then a UPC ratio should be performed)

| UPC ratio | Continue bevacizumab |
| UPC ratio ≥ 3.5 | Hold bevacizumab until UPC recovers to < 3.5 |

| Grade 4 or nephrotic syndrome | Discontinue bevacizumab |

### Hemorrhage (CNS or pulmonary)

| Grade 2-4 | Discontinue bevacizumab |

### Hemorrhage (non-CNS; non-pulmonary)

<p>| Grade 3 | Patients receiving full-dose anticoagulation should discontinue bevacizumab |
|          | For patients not on full-dose anticoagulation, hold bevacizumab until ALL of the following criteria are met: |
|          | - the bleeding has resolved and Hb is stable |
|          | - there is no bleeding diathesis that would increase the risk of therapy |
|          | - there is no anatomic or pathologic condition that could increase the risk of hemorrhage recurrence. |
|          | Patients who experience recurrence of grade 3 hemorrhage should discontinue study therapy |</p>

### 7.4 Modality Review (11/20/13)

The Medical Oncology Co-Chair, Jeffrey Raizer, M.D., will perform a Chemotherapy Assurance Review of all patients who receive or are to receive chemotherapy in this trial. The goal of the review is to evaluate protocol compliance. The review process is contingent on timely submission of chemotherapy treatment data as specified in Section 12.1. The scoring mechanism is: **Per Protocol/Acceptable Variation, Not Per Protocol, and Not Evaluable.** A report is sent to each institution once per year to notify the institution about compliance for each case reviewed in that year.

The Medical Oncology Co-Chair, Jeffrey Raizer, M.D., will perform a Quality Assurance Review after complete data for the first 20 cases enrolled has been received at NRG Oncology. Dr. Raizer will perform the next review after complete data for the next 20 cases enrolled has been received at NRG Oncology. The final cases will be reviewed within 3 months after this study has reached the target accrual or as soon as complete data for all cases enrolled has been received at NRG Oncology, whichever occurs first.

### 7.5 Adverse Events (2/27/14)

This study will utilize the NCI Common Terminology Criteria for Adverse Events (CTCAE) version 4.0 for adverse event (AE) reporting. The CTCAE version 4.0 is located on the CTEP website at [http://ctep.cancer.gov/protocolDevelopment/electronic_applications/ctc.htm](http://ctep.cancer.gov/protocolDevelopment/electronic_applications/ctc.htm). All appropriate treatment areas should have access to a copy of the CTCAE version 4.0.

Adverse events (AEs) that meet expedited reporting criteria defined in the table(s) below will be reported via the CTEP-AERS (CTEP Adverse Event Reporting System) application accessed via either the CTEP website ([https://eapps-ctep.nci.nih.gov/ctepaers/pages/task?rand=1390853489613](https://eapps-ctep.nci.nih.gov/ctepaers/pages/task?rand=1390853489613)).

#### 7.5.1 Adverse Events (AEs)

**Definition of an AE:** Any untoward medical occurrence associated with the use of a drug in humans, whether or not considered drug related. Therefore, an AE can be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease temporarily associated with the use of a medicinal (investigational) product, whether or not considered related...

7.5.2 **Serious Adverse Events (SAEs)**

Serious adverse events (SAEs) that meet expedited reporting criteria defined in the table in Section 7.6 will be reported via CTEP-AERS. SAEs that require 24 hour CTEP-AERS notification are defined in the expedited reporting table in Section 7.6. **Contact the CTEP-AERS Help Desk if assistance is required.**

**Definition of an SAE:** Any adverse drug event (experience) occurring at any dose that results in any of the following outcomes:

- Death;
- A life-threatening adverse drug experience;
- Inpatient hospitalization or prolongation of existing hospitalization;
- A persistent or significant disability/incapacity;
- A congenital anomaly/birth defect;
- Important medical events that may not result in death, be life threatening, or require hospitalization may be considered an SAE, when, based upon medical judgment, they may jeopardize the patient and may require medical or surgical intervention to prevent one of the outcomes listed in the definition.

Due to the risk of intrauterine exposure of a fetus to potentially teratogenic agents, the pregnancy of a study participant must be reported via CTEP-AERS in an expedited manner.

7.5.3 **Acute Myeloid Leukemia (AML) or Myelodysplastic Syndrome (MDS)**

AML or MDS that is diagnosed as a secondary malignancy during or subsequent to treatment in patients on NCI/CTEP-sponsored clinical trials must be reported via the CTEP-AERS within 30 days of AML/MDS diagnosis.

**Secondary Malignancy**

A secondary malignancy is a cancer caused by treatment for a previous malignancy (e.g., treatment with investigational agent/intervention, radiation or chemotherapy). A secondary malignancy is not considered a metastasis of the initial neoplasm.

CTEP requires all secondary malignancies that occur following treatment with an agent under an NCI IND/IDE be reported via CTEP-AERS. Three options are available to describe the event:

- Leukemia secondary to oncology chemotherapy (e.g., acute myelocytic leukemia [AML])
- Myelodysplastic syndrome (MDS)
- Treatment-related secondary malignancy

Any malignancy possibly related to cancer treatment (including AML/MDS) should also be reported via the routine reporting mechanisms outlined in each protocol.

**Second Malignancy**

A second malignancy is one unrelated to the treatment of a prior malignancy (and is NOT a metastasis from the initial malignancy). Second malignancies require ONLY routine reporting via CDUS unless otherwise specified.

7.6 **CTEP-AERS Expedited Reporting Requirements (2/27/14)**

All serious adverse events that meet expedited reporting criteria defined in the reporting table below will be reported via CTEP-AERS, the CTEP Adverse Event Reporting System, accessed via the CTEP website, [https://eapps-ctep.nci.nih.gov/ctepaers/pages/task?rand=1390853489613](https://eapps-ctep.nci.nih.gov/ctepaers/pages/task?rand=1390853489613).

Submitting a report via CTEP-AERS serves as notification to NRG Oncology and satisfies NRG Oncology requirements for expedited adverse event reporting.
CTEP-AERS provides a radiation therapy-only pathway for events experienced that involve radiation therapy only. These events must be reported via the CTEP-AERS radiation therapy-only pathway.

In the rare event when Internet connectivity is disrupted, a 24-hour notification must be made to the NRG Oncology Office at 1-800-227-5463, ext. 4189, for instances when Internet fails. Once internet connectivity is restored, an AE report submitted by phone must be entered electronically into CTEP-AERS.

- CTEP-AERS-24 Hour Notification requires that a CTEP-AERS 24-hour notification is electronically submitted within 24 hours of learning of the adverse event. Each CTEP-AERS 24-hour notification must be followed by a CTEP-AERS 5 Calendar Day Report. Serious adverse events that require 24 hour CTEP-AERS notification are defined in the expedited reporting table below.

- Supporting source document is not mandatory. However, if the CTEP-AERS report indicates in the Additional Information section that source documentation will be provided, then it is expected. If supporting source documentation accompanies a CTEP-AERS report, include the protocol number, patient ID number, and CTEP-AERS ticket number on each page, and fax supporting documentation to the NRG Oncology dedicated SAE FAX, 215-717-0990.

- A serious adverse event that meets expedited reporting criteria outlined in the following table but is assessed by the CTEP-AERS as “expedited reporting NOT required” must still be reported to fulfill NRG Oncology safety reporting obligations. Sites must bypass the “NOT Required” assessment; the CTEP-AERS allows submission of all reports regardless of the results of the assessment.

CTEP defines expedited AE reporting requirements for phase 2 and 3 trials as described in the table below. **Important:** All AEs reported via CTEP-AERS also must be reported on the AE section of the appropriate case report form (see Section 12.1).

**Late Phase 2 and Phase 3 Studies: Expedited Reporting Requirements for Adverse Events that Occur on Studies under an IND/IDE within 30 Days of the Last Administration of the Investigational Agent/Intervention**

<table>
<thead>
<tr>
<th>FDA REPORTING REQUIREMENTS FOR SERIOUS ADVERSE EVENTS (21 CFR Part 312)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NOTE:</strong> Investigators <strong>MUST</strong> immediately report to the sponsor (NCI) ANY Serious Adverse Events, whether or not they are considered related to the investigational agent(s)/intervention (21 CFR 312.64)</td>
</tr>
<tr>
<td>An adverse event is considered serious if it results in <strong>ANY</strong> of the following outcomes:</td>
</tr>
<tr>
<td>1) Death</td>
</tr>
<tr>
<td>2) A life-threatening adverse event</td>
</tr>
<tr>
<td>3) An adverse event that results in inpatient hospitalization or prolongation of existing hospitalization for ≥ 24 hours</td>
</tr>
<tr>
<td>4) A persistent or significant incapacity or substantial disruption of the ability to conduct normal life functions</td>
</tr>
<tr>
<td>5) A congenital anomaly/birth defect.</td>
</tr>
<tr>
<td>6) Important Medical Events (IME) that may not result in death, be life threatening, or require hospitalization may be considered serious when, based upon medical judgment, they may jeopardize the patient or subject and may require medical or surgical intervention to prevent one of the outcomes listed in this definition. (FDA, 21 CFR 312.32; ICH E2A and ICH E6).</td>
</tr>
</tbody>
</table>

**ALL SERIOUS** adverse events that meet the above criteria **MUST** be immediately reported to the NCI via CTEP-AERS within the timeframes detailed in the table below.
<table>
<thead>
<tr>
<th>Hospitalization</th>
<th>Grade 1 Timeframes</th>
<th>Grade 2 Timeframes</th>
<th>Grade 3 Timeframes</th>
<th>Grade 4 &amp; 5 Timeframes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resulting in Hospitalization ≥ 24 hrs</td>
<td>10 Calendar Days</td>
<td></td>
<td></td>
<td>24-Hour 5 Calendar Days</td>
</tr>
<tr>
<td>Not resulting in Hospitalization ≥ 24 hrs</td>
<td>Not required</td>
<td></td>
<td>10 Calendar Days</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE** Protocol specific exceptions to expedited reporting of serious adverse events are found in the Specific Protocol Exceptions to Expedited Reporting (SPEER) portion of the CAEPR Expedited AE reporting timelines are defined as:

- **“24-Hour; 5 Calendar Days”** - The AE must initially be reported via CTEP-AERS within 24 hours of learning of the AE, followed by a complete expedited report within 5 calendar days of the initial 24-hour report.
- **“10 Calendar Days”** - A complete expedited report on the AE must be submitted within 10 calendar days of learning of the AE.

1Serious adverse events that occur more than 30 days after the last administration of investigational agent/intervention and have an attribution of possible, probable, or definite require reporting as follows:

**Expedited 24-hour notification followed by complete report within 5 calendar days for:**
- All Grade 4, and Grade 5 AEs

**Expedited 10 calendar day reports for:**
- Grade 2 adverse events resulting in hospitalization or prolongation of hospitalization
- Grade 3 adverse events

2 For studies using PET or SPECT IND agents, the AE reporting period is limited to 10 radioactive half lives, rounded UP to the nearest whole day, after the agent/intervention was last administered. Footnote “1” above applies after this reporting period.

Date: May 5, 2011

**Additional Instructions or Exceptions to CTEP-AERS Expedited Reporting Requirements for Phase 2 and 3 Trials Utilizing an Agent under a CTEP-IND [or Non-CTEP IND]:**

Not applicable.

8.0 **SURGERY**

Not applicable to this study.

9.0 **OTHER THERAPY**

9.1 **Permitted Supportive Therapy**

All supportive therapy for optimal medical care will be given during the study period at the discretion of the attending physician(s) within the parameters of the protocol and documented on each site’s source documents as concomitant medication.

9.1.1 Anticonvulsants: No limitations in type of anti-convulsants used.

9.1.2 Antiemetics: Prophylactic medications are not needed. For nausea, anti-emetics may be used based on the treating physician’s preference.

9.1.3 Anticoagulants: These may be used for the treatment of DVT’s or PE’s if they occur. Preference should be given for LMW Heparins, but Coumadin is allowed.

9.1.4 Antidiarrheals: Used as needed per treating physician’s discretion.

9.1.5 Analgesics: Used as needed per treating physician’s discretion.

9.1.6 Hematopoietic Growth Factors: Used as needed per treating physician’s discretion.
9.1.7 Herbal products: Are allowed but patients should inform treating physician and these should be recorded.

9.1.8 Nutritional supplementation: Are allowed but patients should inform treating physician and these should be recorded.

9.2 Non-permitted Supportive Therapy
9.2.1 Patients should avoid the use of medications that have anti-oxidant properties during radiation.

10.0 TISSUE/SPECIMEN SUBMISSION
NOTE: Patients must be offered the opportunity to participate in the correlative components of the study, such as tissue/specimen submission or quality of life assessment. If the patient consents to participate in the tissue/specimen component of the study, the site is required to submit the patient’s specimens as specified in Section 10.0 of the protocol. Sites are not permitted to delete the tissue/specimen component from the protocol or from the sample consent.

10.1 Tissue/Specimen Submission
The NRG Oncology Biospecimen Bank at the University of California San Francisco acquires and maintains high quality specimens from NRG Oncology trials. Tissue from each block is preserved through careful block storage and processing. NRG Oncology encourages participants in protocol studies to consent to the banking of their tissue. The NRG Oncology Biospecimen Bank provides tissue specimens to investigators for translational research studies. Translational research studies integrate the newest research findings into current protocols to investigate important biologic questions.

In this study, tissue will be submitted to the NRG Oncology Biospecimen Bank for the purpose of tissue banking and translational research (highly recommended).

10.2 Specimen Collection for Banking and Translational Research (Highly Recommended) (10/9/14)
For patients who have consented to participate in the specimen collection component of the study.

The following must be provided in order for the case to be evaluable for the NRG Oncology Biospecimen Bank:

10.2.1 Tissue (For collection, processing and shipping information please see Specimen Collection Summary below and Appendix III.)
- One H&E stained slide (slide can be a duplicate cut stained H&E of the diagnostic slide (block); it does not have to be the diagnostic slide itself)
- A corresponding paraffin-embedded tissue block of the tumor (the block must match the H&E being submitted) or a 2 mm diameter core of tumor tissue, punched from the tissue block containing the tumor with a punch tool and submitted in a plastic tube labeled with the surgical pathology number. Note: A kit with the punch, tube, and instructions can be obtained free of charge from the NRG Oncology Biospecimen Bank. Block or core must be clearly labeled with the pathology identification number and block number that corresponds to the Pathology Report (see below).
  - The submitted material must be from malignant tumor, not necrotic or fibrotic tissue.
    - If the submitted material is reviewed and is not tumor, the site may be assessed a protocol violation.
  - A Pathology Report documenting that the submitted block or core contains tumor. The report must include the NRG Oncology protocol number and patient’s case number. The patient’s name and/or other identifying information should be removed from the report. The surgical pathology numbers and information must NOT be removed from the report.
- A Specimen Transmittal (ST) Form clearly stating that tissue is being submitted for NRG Oncology Biospecimen Bank; if for translational research, this should be stated on the form. The form must include the NRG Oncology protocol number and patient’s case number.
10.2.2 Blood and Urine (For collection, processing and shipping information please see Specimen Collection Summary below and Appendix III.)

A Specimen Transmittal Form documenting the type of Biospecimen, the date of collection of the biospecimen; the NRG Oncology protocol number, the patient’s case number, time point of study, and method of storage, for example, stored at -80°C, must be included.

10.2.3 Storage Conditions for All Specimens
Store frozen specimens at -80°C (-70°C to -90°C) until ready to ship. If a -80°C Freezer is not available:
- Samples can be stored short term in a -20°C freezer (non-frost free preferred) for up to one week (please ship out Monday-Wednesday only; Canada: Monday-Tuesday).
  OR:
- Samples can be stored in plenty of dry ice for up to one week, replenishing daily (ship out Monday-Wednesday only; Canada: Monday-Tuesday).
  OR:
- Samples can be stored in liquid nitrogen vapor phase (ship out Monday-Wednesday only; Canada: Monday-Tuesday).

Please indicate on the ST Form the storage conditions used and time stored.

10.2.4 Specimen Collection Summary

<table>
<thead>
<tr>
<th>Specimens taken from patient:</th>
<th>Collected when:</th>
<th>Submitted as:</th>
<th>Shipped:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Representative H&amp;E stained slides of the primary tumor</td>
<td>Pre-treatment</td>
<td>H&amp;E stained slide</td>
<td>Slide shipped ambient</td>
</tr>
<tr>
<td>A paraffin-embedded tissue block of the primary tumor taken before initiation of treatment or a 2 mm diameter core of tissue, punched from the tissue block with a punch tool</td>
<td>Pre-treatment</td>
<td>Paraffin-embedded tissue block or punch biopsy (must match the H&amp;E slide being submitted)</td>
<td>Block or punch shipped ambient. Cold packs are recommended during warm weather to help prevent blocks from melting</td>
</tr>
<tr>
<td>SERUM: 5-10 mL of whole blood in 1 red-top tube and centrifuge</td>
<td>(1) Pre-treatment (2) 8 weeks after treatment initiation</td>
<td>Frozen serum samples containing 0.5 mL per aliquot in 1 mL cryovials (five to eight)</td>
<td>Serum sent frozen on dry ice via overnight carrier</td>
</tr>

<td>PLASMA: 5-10 mL of anticoagulated whole blood in EDTA tube #1 (purple/lavender top) and</td>
<td>(1) Pre-treatment (2) 8 weeks after treatment initiation</td>
<td>Frozen plasma samples containing 0.5 mL per aliquot in 1 mL cryovials (five to eight)</td>
<td>Plasma sent frozen on dry ice via overnight carrier</td>
</tr>
</tbody>
</table>
Whole blood for DNA: 5-10 mL of anticoagulated whole blood in EDTA tube #2 (purple/ lavender top) and mix

Frozen whole blood samples containing 1.0 mL per aliquot in 1 mL cryovials (three-five)

Whole blood sent frozen on dry ice via overnight carrier

10-20 mL clean-catch urine

Two 5-10 mL urine aliquots in 2 sterile 15 ml polypropylene centrifuge tubes. Store frozen at -20° or 80° C

Urine sent frozen on dry ice via overnight carrier

10.2.5 Submit materials for Specimen Banking, Translational Research as follows:

U. S. Postal Service Mailing Address: For Non-frozen Specimens Only
NRG Oncology Biospecimen Bank
University of California San Francisco
UCSF Box 1800
2340 Sutter Street, Room S341
San Francisco, CA 94143-1800

Courier Address (FedEx, UPS, etc.): For Trackable FFPE and ALL Frozen Specimens
NRG Oncology Biospecimen Bank
University of California San Francisco
2340 Sutter Street, Room S341
San Francisco, CA 94115

Questions: 415-476-7864/FAX 415-476-5271; RTOG@ucsf.edu

10.3 Reimbursement (4/15/14)
Please note that with the start of the new NCI National Clinical Trials Network (NCTN) Program, NCI funds for reimbursement for protocol-specified biospecimen materials will be distributed per the requirements/methods specified by the new NCTN Program. This information will be made available with the other registration materials in the Oncology Patient Enrollment Network (OPEN) portal system. OPEN will serve as the registration system for all patient enrollments onto NCI-sponsored NCTN trials, including this study, which will be transitioned into the new Program from the NCI-sponsored Cooperative Group Clinical Trials Program.

10.4 Confidentiality/Storage

10.4.1 Upon receipt, the specimen is labeled with the NRG Oncology protocol number and the patient’s case number only. The NRG Oncology Biospecimen Bank database only includes the following information: the number of specimens received, the date the specimens were received, documentation of material sent to a qualified investigator, type of material sent, and the date the specimens were sent to the investigator. No clinical information is kept in the database.

10.4.2 Specimens for tissue banking will be stored for an indefinite period of time. Specimens for the translational research component of this protocol will be retained until the study is terminated, unless the patient has consented to storage for future studies. If at any time the patient withdraws consent to store and use specimens, the material will be returned to the institution that submitted it.
11.0 PATIENT ASSESSMENTS

11.1 Study Parameters: See Appendix I. See below for additional details. (11/20/13)

11.1.1 Urine should be assessed via dipstick or random urine creatinine and protein before each dose of bevacizumab. If dipstick is > 2 + then a UPC ratio should be performed.

11.1.2 Vital signs should be assessed before each dose of bevacizumab (on treatment day) to make sure there is no increase in blood pressure.

11.1.3 MR diffusion and perfusion imaging at 8 and 24 weeks post-treatment start is optional but strongly recommended. Repeat MR diffusion and perfusion imaging at progression is optional but strongly recommended as further confirmation of true tumor progression and not radiation necrosis.

11.2 Measurement of Response

The primary measure of response will be by serial measures of the product of the two largest cross-sectional diameters using MacDonald Criteria. Response will also be evaluated in this study using the international criteria proposed by the Response Evaluation Criteria in Solid Tumors (RECIST) Committee [JNCI 92(3): 205-216, 2000], see Section 11.4.

11.2.1 Complete Response (CR)

Requires all of the following: complete disappearance of the measurable enhancing lesion sustained for at least 4 weeks; no new lesions; and no corticosteroids.

11.2.2 Partial Response (PR)

Requires all of the following: ≥ 50% decrease compared with baseline in the sum of products of perpendicular diameters of the measurable enhancing lesion sustained for at least 4 weeks; no new lesions; and stable or reduced corticosteroid dose.

11.2.3 Stable Disease (SD)

Requires all of the following: does not qualify for complete response, partial response, or progression and is receiving stable or decreasing doses of steroids. This will not require a confirmatory scan.

11.2.4 Progression (P)

Defined by any of the following: ≥ 25% increase in sum of the products of perpendicular diameters of enhancing lesions provided that the patient has not had his/her dose of steroids decreased since the last evaluation period; and any new lesions. This will not require a confirmatory scan. A concomitant decrease in steroid dose will rule out a progression designation during the initial 12 weeks after completion of RT.

11.2.5 Pseudo-progression

Due to possible radiation effects using large dose per fraction, the initial scan 6 weeks following RT should NOT be used to declare progression. In the absence of neurologic worsening OR a new distant area of tumor, the initial post-radiation scan should not be used to declare progression. Progressive worsening on subsequent imaging studies usually distinguishes true progression from pseudo-progression.

11.2.6 If true progression is determined by subsequent imaging, then the date of progression returns to the earlier date with increasing mass.

11.3 Criteria for Evaluation of Therapy Effectiveness

11.3.1 Tumor response and regrowth can frequently be difficult to measure directly. Serial neurological exams and CT/MRI scans may provide a guide to the actual course. Time interval to progression will be measured from registration until deterioration is documented by the individual investigator using these guides. The patient should consistently be followed with the same diagnostic imaging study (CT or MRI). (NOTE: CT option ONLY for patients unable to undergo MR imaging because of non-compatible devices.)

11.3.2 Overall survival will be measured from registration until death. Progression-free survival will be measured from registration until the first occurrence of progression or death.

11.3.3 The quality of survival will be measured by neurological functional classification and performance status.

11.3.4 Toxicities will be measured using the CTCAE criteria, version 4.0.
11.4 RANO Response Criteria

Efficacy determinations using RANO response criteria (Wen 2010) also will be obtained.

11.4.1 Response Criteria

Radiographic response should be determined in comparison to the tumor measurement obtained at pretreatment baseline for determination of response, and the smallest tumor measurement at either pretreatment baseline or following initiation of therapy for determination of progression. The tables below outline the criteria for radiographic changes following therapy and summarize RANO response criteria. In the event that the radiographic changes are equivocal and it is unclear whether the patient is stable or has developed progressive disease, it is permissible to continue treatment and observe the patient closely, for example at 4 weekly intervals. If subsequent imaging studies demonstrate that progression has occurred, the date of progression should be the scan at which this issue was first raised.

All measurable and non-measurable lesions should be assessed using the same techniques as baseline. Ideally patients should be imaged on the same MRI, or least with the same magnet strength, for the duration of the study to reduce difficulties in interpreting changes.

All measurable and non-measurable lesions must be assessed using the same techniques as baseline.

### Criteria for Response Assessment Incorporating MRI and Clinical Factors

<table>
<thead>
<tr>
<th>Complete Response:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires all of the following:</td>
</tr>
<tr>
<td>a) Complete disappearance of all enhancing measurable and non-measurable disease sustained for at least 4 weeks.</td>
</tr>
<tr>
<td>b) No new lesions.</td>
</tr>
<tr>
<td>c) Stable or improved non-enhancing (T2/FLAIR) lesions.</td>
</tr>
<tr>
<td>d) Patients must be off corticosteroids (or on physiologic replacement doses only).</td>
</tr>
<tr>
<td>e) Stable or improved clinically.</td>
</tr>
</tbody>
</table>

Note: Patients with non-measurable disease only cannot have a complete response. The best response possible is stable disease.

<table>
<thead>
<tr>
<th>Partial Response:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires all of the following:</td>
</tr>
<tr>
<td>a) Greater than or equal to 50% decrease compared to baseline in the sum of products of perpendicular diameters of all measurable enhancing lesions sustained for at least 4 weeks.</td>
</tr>
<tr>
<td>b) No progression of non-measurable disease.</td>
</tr>
<tr>
<td>c) No new lesions.</td>
</tr>
<tr>
<td>d) Stable or improved non-enhancing (T2/FLAIR) lesions on same or lower dose of corticosteroids compared to baseline scan.</td>
</tr>
<tr>
<td>e) The corticosteroid dose at the time of the scan evaluation should be no greater than the dose at...</td>
</tr>
</tbody>
</table>
time of baseline scan.
f) Stable or improved clinically.

Note: Patients with non-measurable disease only cannot have a partial response. The best response possible is stable disease.

**Stable Disease:**
Requires all of the following:

a) Does not qualify for complete response, partial response, or progression.
b) Stable non-enhancing (T2/FLAIR) lesions on same or lower dose of corticosteroids compared to baseline scan. In the event that the corticosteroid dose was increased for new symptoms and signs without confirmation of disease progression on neuroimaging, and subsequent follow-up imaging shows that this increase in corticosteroids was required because of disease progression, the last scan considered to show stable disease will be the scan obtained when the corticosteroid dose was equivalent to the baseline dose.
c) Stable clinically.

**Progression:**
Defined by any of the following:

a) Greater than > 25% increase in sum of the products of perpendicular diameters of enhancing lesions compared to the smallest tumor measurement obtained either at baseline (if no decrease) or best response, on stable or increasing doses of corticosteroids.*
b) Significant increase in T2/FLAIR non-enhancing lesion on stable or increasing doses of corticosteroids compared to baseline scan or best response following initiation of therapy,* not due to co-morbid events (e.g. radiation therapy, demyelination, ischemic injury, infection, seizures, post-operative changes, or other treatment effects).
c) Any new lesion.
d) Clear clinical deterioration not attributable to other causes apart from the tumor (e.g. seizures, medication side effects, complications of therapy, cerebrovascular events, infection, etc.) or changes in corticosteroid dose.
e) Failure to return for evaluation due to death or deteriorating condition.
f) Clear progression of non-measurable disease.

*Stable doses of corticosteroids include patients not on corticosteroids

---

### Summary of RANO Response Criteria

</table>
Abbreviations: RANO, Response Assessment in Neuro-Oncology; CR=complete response; PR=partial response; SD=stable disease; PD=progressive disease; FLAIR, fluid-attenuated inversion recovery; ↓ = decrease; ↑ = increase

# Progression occurs when any of the criteria with * is present.

NA**: Increase in corticosteroids alone will not be taken into account in determining progression in the absence of persistent clinical deterioration.

11.4.2 Efficacy Assessments

- **Progression free survival (PFS)** will be defined from the time the patient enters the study until there is clinical or radiographic evidence of progressive disease (see definition of PD above).
- **Overall survival (OS)** will be defined from the time the patient enters the study to the date of death. Patients not known to have died will be censored for survival as of the last date known alive.
- **PFS and overall survival** will be estimated by using the Kaplan-Meier method.
- The primary endpoint for this study is overall survival.

11.5 Criteria for Discontinuation of Protocol Treatment

- Progression of disease (See Section 11.2)
- Unacceptable toxicity to the patient (at the discretion of the treating physician) — Reasons for removal must be clearly documented on the appropriate case report form/flow sheet, and NRG Oncology data management must be notified.

If protocol treatment is discontinued, follow up and data collection will continue as specified in the protocol.
12.0 DATA COLLECTION
Data should be submitted to:

NRG Oncology*
1818 Market Street, Suite 1600
Philadelphia, PA  19103

*If a data form is available for web entry, it must be submitted electronically.

Patients will be identified by initials only (first middle last); if there is no middle initial, a hyphen will be used (first-last). Last names with apostrophes will be identified by the first letter of the last name.

12.2 Summary of Dosimetry Digital Data Submission (Submit to TRIAD; see Section 5.5 for account access and installation instructions) (4/15/14)

Preliminary Dosimetry Information
Digital Data Submission – Treatment Within 1 week of start of RT

Digital data submission includes the following, all in DICOM format:
- CT data, critical normal structures, all GTV, CTV, and PTV contours
- Digital beam geometry beam sets
- Single dose file for concurrently treated beams
- Digital DVH data for all required critical normal structures, GTV, CTV, and PTVs for total dose plan
- All required structures MUST be labeled per Table in Section 6.5.1.
The “RTOG 1205 Datasheet” is available in the Forms section of the NRG Oncology/RTOG web site, http://www.rtog.org/ClinicalTrials/ProtocolTable/StudyDetails.aspx?study=1205. Submit via TRIAD with the digital data listed above.

Upon submission of any digital data via TRIAD, complete an online digital data submission form (DDSI) located on the NRG Oncology/RTOG web site at http://www.rtog.org/ClinicalTrials/ProtocolTable/StudyDetails.aspx?study=1205.

Final Dosimetry Information

- Radiotherapy Form (T1) via the web
- Daily Treatment Record (T5) on paper to HQ

NOTE: ALL SIMULATION AND PORTAL FILMS AND/OR DIGITAL FILM IMAGES WILL BE KEPT BY THE INSTITUTION AND ONLY SUBMITTED IF REQUESTED.
13.0  STATISTICAL CONSIDERATIONS
13.1  Study Endpoints (11/20/13)
13.1.1  Primary Endpoint
Overall Survival, defined as the interval from randomization to death due to any cause.
13.1.2  Secondary Endpoints
- Objective response
- 6-month progression-free survival
- Progression-free survival, defined as the interval from randomization to progression or death, whichever occurs first
- Treatment adverse events
- Grade 3+ acute or delayed CNS toxicity

13.2  Sample Size and Power Justification
The primary objective of this study is to determine whether re-irradiation plus bevacizumab (experimental arm) will improve the overall survival compared to bevacizumab alone (control arm). The design will be a randomized phase II screening trial as proposed by Rubinstein et al (2005). The randomization of experimental and control arms is 1:1. The null hypothesis is that the overall survival for both arms is 9 months, based on data from RTOG 0625/ACRIN 6677 and the BRAIN study. The alternative hypothesis is that patients receiving IMRT plus bevacizumab will have an improvement in overall survival to 13 months, based on the Gutin data. With 160 eligible subjects, there will be 80% power to detect a 31% reduction in the hazard ratio to 0.69 at the significance level of 0.10 (one-sided). Analysis will be performed when 135 events (deaths) are reported, expected to occur 16 to 21 months after trial closure. Guarding against up to a 10% ineligibility rate, the final target accrual for this study will be 178 cases.

13.3  Patient Accrual
Based on the monthly accrual for a prior RTOG recurrent glioblastoma phase II study (RTOG 0625), this study is projected to accrue 10 cases/month. Therefore, the target accrual should be completed within 22 months of study activation, allowing slow accrual in the first 6 months. If the average monthly accrual (6 months after trial activation) is less than 5 patients, the study will be re-evaluated with respect to feasibility.

13.4  Patient Stratification and Randomization (4/15/14)
A randomized phase II trial will be conducted for bevacizumab-naïve recurrent GBM patients. Age and Karnofsky performance status (KPS) are demonstrated to be prognostic of survival for recurrent GBM (Carson 2007). In addition, previous RTOG recurrent GBM trials (RTOG 0625, 0627) show that age, KPS, and resection type have prognostic value in overall survival. Therefore, for this NRG Oncology recurrent GBM study, patients will be stratified by age (<50 vs. ≥50), KPS (60 vs. 70-80 vs.90-100), and resection type (yes vs. no/biopsy only), and then randomized to either the control arm or experimental arm in a permuted block design using the method described by Zelen (1974).

13.5  Analyses Plans
13.5.1  Statistical Methods
Overall and progression-free survival rates will be estimated using the Kaplan-Meier method (Kaplan 1958), and differences between treatment arms will be tested in the log-rank test (Mantel 1966). Overall survival will be measured from the date of randomization to the date of death or, otherwise, the last follow-up date on which the patient was reported alive. Progression-free survival will be measured from the date of randomization to the date of first progression or death or, otherwise, the last follow-up date on which the patient was reported alive.

Objective response rate, grade 3+ toxicities rate, acute or delayed CNS toxicity rate, and 6-month progression-free survival rate, will be estimated using an exact binomial distribution together with 95% confidence interval. The difference between the 2 groups will be tested using a chi square test. In terms of grade 3+ toxicity and acute/delayed toxicity, all patients receiving any protocol
treatment (bevacizumab or combination of RT with bevacizumab) should be included. For the statistical comparison of the primary endpoint (overall survival), the type I error is set as 0.1 (1-sided), while for all the secondary endpoints, the statistical comparison between groups will serve as an exploratory purpose without multiple comparison adjustment, with type I error of 0.05 (2-sided) for each comparison.

Multivariate analyses with the Cox proportional hazard model (Cox 1972) for overall and progression-free survival will be performed with the stratification variables as fixed variables to assess the treatment effect adjusting patient-specific risk factors. The covariates evaluated for the multivariate models are assigned protocol treatment, tumor volume at the time of treatment, time since original diagnosis, stratification factors, and other prognostic factors. Proportional hazard assumptions will be checked using different graphical or time-varying coefficients testing methods. If the data clearly do not follow proportional hazards, other statistical models will be used to fit the data instead. Possible alternatives are to use the stratified Cox proportional hazard model, accelerated failure model, or partition the time axis into sections where proportional hazard assumption holds.

13.5.2 **Interim Toxicity and Futility Analysis**

Due to a possible increased incidence of grade 3+ CNS toxicity (possibly, probably, or definitely related to treatment) occurring during the first 6 months post RT in the experimental arm, a special interim analysis will be performed after the first 20 patients enrolled to the experimental arm have a minimum 6-month follow-up. If the incidence of grade 3+ CNS toxicity (based on RTOG 0625) is 20% higher, or 30%, in the experimental arm, the trial will be halted due to lack of safety. The interim toxicity analysis results will be reported to the NRG Oncology DMC. The DMC will then make a recommendation about the trial to the NRG Oncology Group Co-Chairs.

The interim futility analysis will be performed when 50% of the required events (68 deaths) are reported. The analysis will be performed on an intent-to-treat basis, with all eligible cases included in the treatment arm to which they were randomized regardless of what treatment the patients actually received. The primary endpoint, overall survival, will be tested. The futility will be tested using the conditional probability under the alternative hypothesis of detecting the hypothesized treatment benefit favoring the experimental arm at the final analysis given the observed data. The results from testing the treatment futility will be reported to the NRG Oncology DMC. The responsible statistician may recommend early reporting of the results and/or stopping accrual (if applicable) of the trial if the conditional power is less than 0.1. The accrual rate, treatment compliance, safety of the treatments, and the importance of the study are also considered in making such a recommendation. The results will be reported to the RTOG DMC with the treatment blinded. The DMC will then make a recommendation about the trial to the NRG Oncology Group Co-Chair.

13.5.3 **Interim Analysis to Monitor Study Progress**

Interim reports with statistical analyses are prepared every 6 months until the initial manuscript reporting the treatment results has been submitted. The reports contain:

- The patient accrual rate with a projected accrual completion date
- Accrual by institution
- The pretreatment characteristics of accrued patients
- The frequency and severity of toxicities
- The results of any completed study chair modality reviews

The interim reports will not contain the results from the treatment comparisons with respect to the efficacy endpoints (overall survival, progression-free survival, treatment response). The NRG Oncology DMC will review the accrual to the study and the rate of adverse events on the study at least twice per year until the initial results of the study have been presented to the scientific community.

13.5.4 **Significance Testing for Final Analysis**

The final analysis will be performed on an intent-to-treat basis, such that all eligible cases on the study will be included in the arm to which they were randomized regardless of what treatment the patients actually received. The analysis to report the final results of treatment comparison between the experimental arm and the control arm will be undertaken when 135 events (deaths)
have been reported. A one-sided log-rank test will be performed to test the difference in overall survival between the two treatment arms. If the p value is less than protocol-specified 0.10 (one sided), the study statistician will reject the null hypothesis and conclude that the experimental arm (re-radiation plus bevacizumab) is promising in prolonging overall survival, therefore supporting the development of a confirmatory phase III trial comparing this regimen to the current standard treatment. All information reported in the interim analyses to monitor the study progress (above) and the treatment compliance with respect to re-radiation and chemotherapy will also be included in the final report.

13.5.5 This study will be monitored by the Clinical Data Update System (CDUS) version 3.0. Cumulative CDUS data will be submitted quarterly by electronic means. Reports are due January 31, April 30, July 31, and October 31.

13.6 Gender and Minorities
In conformance with the National Institutes of Health (NIH) Revitalization Act of 1993 with regard to inclusion of women and minorities in clinical research, both men and women of all races and ethnic groups are eligible for this study. We will also analyze treatment differences by gender, race, and ethnicity. The following table lists the projected accrual for each racial and ethnic group based upon previous RTOG recurrent GBM trials.

APPENDIX III (10/9/14)

Appendices for NRG Oncology Biospecimen Collection (as specified by the protocol).
NRG Oncology FFPE Specimen Plug Kit Collection
NRG Oncology Blood Collection Kit Instructions
NRG Oncology Urine Collection Kit Instructions

Shipping Instructions:

U.S. Postal Service Mailing Address: For FFPE or Non-frozen Specimens Only
NRG Oncology Biospecimen Bank
University of California San Francisco
UCSF Box 1800
2340 Sutter Street, Room S341
San Francisco, CA 94143-1800

Courier Address (FedEx, UPS, etc.): For Frozen or Trackable Specimens
NRG Oncology Biospecimen Bank
University of California San Francisco
2340 Sutter Street, Room S341
San Francisco, CA 94115

- Include all NRG Oncology paperwork in pocket of biohazard bag.
- Check that the Specimen Transmittal (ST) Form has the consent boxes checked off.
- Check that all samples are labeled with the NRG Oncology study and case number, and include date of collection as well as collection time point (e.g., pretreatment, post-treatment).

**FFPE Specimens:**
- Slides should be shipped in a plastic slide holder/slide box. Place a small wad of padding in top of the container. If you can hear the slides shaking it is likely that they will break during shipping.
- FFPE Blocks can be wrapped in paper or placed in a cardboard box with padding. Do not wrap blocks with bubble wrap or gauze. Place padding in top of container so that if you shake the container the blocks are not shaking. If you can hear the block shaking it might break during shipping.
- Slides, Blocks, or Plugs can be shipped ambient or with a cold pack either by United States Postal Service (USPS) to the USPS address (94143) or by Courier to the Street Address (94115). Do NOT ship on Dry Ice.

**Frozen Specimens:**
- Multiple cases may be shipped in the same cooler, but make sure each one is in a separate bag and clearly identified. If possible keep Serum, Plasma, and Whole Bloods in separate bags.
- Place specimens and absorbent shipping material in Styrofoam cooler filled with dry ice (at least 7 lbs). There should be plenty of dry ice under and above the specimens. If the volume of specimens is greater than the volume of dry ice then ship in a larger Styrofoam box, or two separate boxes. Any Styrofoam box can be used, as long as it is big enough.
- Specimens received thawed due to insufficient dry ice or shipping delays will be discarded and the site will be notified.
- Send frozen specimens on dry ice via overnight courier to the address above. Specimens should only be shipped Monday through Wednesday (Monday-Tuesday for Canada) to prevent thawing due to delivery delays. Saturday or holiday deliveries cannot be accepted. Samples can be stored frozen at -80°C until ready to ship.

For Questions regarding collection/shipping please contact the NRG Oncology Biospecimen Bank by e-mail: RTOG@ucsf.edu or phone: 415-476-7864 or Fax: 415-476-5271.
NRG ONCOLOGY FFPE SPECIMEN PLUG KIT INSTRUCTIONS

This Kit allows sub-sampling of an FFPE block for submission to the NRG Oncology Biospecimen Bank. The plug kit contains a shipping tube and a punch tool.

Step 1
If the block is stored cold, allow it to equilibrate for 30 minutes at room temperature. Place the punch tool on the paraffin block over the selected tumor area. (Ask a pathologist to select area with tumor.) Push the punch into the paraffin block. Twist the punch tool once around to separate the plug from the block. Then pull the punch tool out of the block. The punch should be filled with tissue sample.

Step 2
Label the punch tool with the proper specimen ID. Include the pathology accession number and block ID. DON’T remove specimen from the punch.

Use a separate punch tool for every specimen. Call or e-mail us if you have any questions or need additional specimen plug kits.

Step 3
Once punch tool is labeled, place in shipping tube and mail to address below. Please do not mix specimens in the same tube.

We will remove core specimen from the punch, embed in a paraffin block, and label with specimen ID.

*NOTE:* If your facility is uncomfortable obtaining the plug but wants to retain the tissue block, please send the entire block to the NRG Oncology Biospecimen Bank and we will sample a plug from the block and return the remaining block to your facility. Please indicate on the submission form the request to perform the plug procedure and return of the block.

Ship specimen plug kit, specimen in punch tool, and all paperwork to the address below. For Questions regarding collection/shipping or to order an FFPE Specimen Plug Kit, please contact the NRG Oncology Biospecimen Bank by e-mail: RTOG@ucsf.edu or call 415-476-7864/Fax 415-476-5271.

U.S. Postal Service Mailing Address:
For Non-frozen Specimens Only
NRG Oncology Biospecimen Bank
University of California San Francisco
UCSF Box 1800
2340 Sutter Street, Room S341
San Francisco, CA 94143-1800

 Courier Address (FedEx, UPS, etc.): 
 For Frozen Specimens or Trackable shipments
NRG Oncology Biospecimen Bank
University of California San Francisco
2340 Sutter Street, Room S341
San Francisco, CA 94115
NRG ONCOLOGY BLOOD COLLECTION KIT INSTRUCTIONS

This Kit is for collection, processing, storage, and shipping of serum, plasma, or whole blood (as specified by the protocol):

Kit contents:
- One Red Top tube for serum (A)
- One Purple Top EDTA tube for plasma (B)
- One Purple Top EDTA tube for Whole Blood (C)
- Twenty-one (21) 1 ml cryovials
- Biohazard bags (3) and Absorbent shipping material (3)
- Styrofoam container (inner) and Cardboard shipping (outer) box
- UN1845 DRY Ice Sticker and UN3373 Biological Substance Category B Stickers
- Specimen Transmittal (ST) Form and Kit Instructions

PREPARATION AND PROCESSING OF SERUM, PLASMA AND WHOLE BLOOD:

(A) Serum (if requested): Red Top Tube
- Label as many 1ml cryovials (5 to 8) as necessary for the serum collected. Label them with the NRG Oncology study and case number, collection date, time, and time point, and clearly mark cryovials “serum”.

Process:
1. Allow one red top tube to clot for 30 minutes at room temperature.
2. Spin in a standard clinical centrifuge at ~2500 RPM for 10 minutes at 4°C (preferred). If sites are unable to process samples at 4°C then spinning at room temperature is acceptable if done within 2 hours of draw but must be noted on the ST Form.
3. Aliquot 0.5 ml serum into as many cryovials as are necessary for the serum collected (5 to 8) labeled with NRG Oncology study and case numbers, collection date/time, protocol time-point collected (e.g. pretreatment, post-treatment), and clearly mark specimen as “serum”. If an aliquot has less than 0.5 ml in the tube please note the volume on the vial and make a note on the ST Form.
4. Place cryovials into biohazard bag and immediately freeze at -70 to -90°C, and store frozen until ready to ship. See below for storage conditions.
5. Store serum at -70 to -90°C until ready to ship on dry ice. See below for storage conditions.

PLEASE MAKE SURE THAT EVERY SPECIMEN IS LABELED and include collection time point on the ST Form.

(B) Plasma (if requested): Purple Top EDTA tube #1
- Label as many 1ml cryovials (5 to 8) as necessary for the plasma collected. Label them with the NRG Oncology study and case number, collection date, time, and time point, and clearly mark cryovials “plasma”.

Process:
1. After collection, invert tube(s) multiple times to ensure adequate mixing of EDTA.
2. Centrifuge specimen(s) within one hour of collection in a standard clinical centrifuge at ~2500 RPM for 10 minutes at 4°C (preferred). If sites are unable to process samples at 4°C then spinning at room temperature is acceptable if done within 2 hours of draw but must be noted on the ST Form.
3. If the interval between specimen collection and processing is anticipated to be more than one hour, keep specimen on ice until centrifuging is performed.
4. Carefully pipette and aliquot 0.5 ml plasma into as many cryovials as are necessary for the plasma collected (5 to 8) labeled with NRG Oncology study and case numbers, collection date/time, time point collected and clearly mark specimen as “plasma”. Avoid pipetting up the buffy coat layer. If an aliquot has less than 0.5 ml in the tube please note the volume on the vial and make a note on the ST Form.
5. Place cryovials into biohazard bag and immediately freeze at -70 to -90°C.
6. Store frozen plasma until ready to ship on dry ice.
7. See below for storage conditions.
PLEASE MAKE SURE THAT EVERY SPECIMEN IS LABELED and include collection time point on the ST Form.

(C) Whole Blood for DNA (if requested): Purple Top EDTA tube #2
- Label as many 1ml cryovials (3 to 5) as necessary for the whole blood collected. Label them with the NRG Oncology study and case number, collection date/time, and time point, and clearly mark cryovials "blood".

Process:
1. After collection, invert tube(s) multiple times to ensure adequate mixing of EDTA. Blood can also be mixed for 5 minutes on a mixer at room temperature.
2. Carefully pipette and aliquot 1.0 ml blood into as many cryovials as are necessary for the blood collected (3 to 5) labeled with NRG Oncology study and case numbers, collection date/time, time point collected and clearly mark specimen as “blood”. If an aliquot has less than 1.0 ml in the tube please note the volume on the vial and make a note on the ST Form.
3. Place cryovials into biohazard bag and freeze immediately at -70 to -80 °Celsius.
4. Store blood samples frozen until ready to ship on dry ice.
5. See below for storage conditions.

PLEASE MAKE SURE THAT EVERY SPECIMEN IS LABELED and include collection time point on ST Form.

Freezing and Storage:
- Freeze Blood samples in a -80°C Freezer or on Dry Ice or snap freeze in liquid nitrogen.
- Store at –80°C (-70°C to -90°C) until ready to ship.
  - If a -80°C Freezer is not available,
    - Samples can be stored short term in a -20°C freezer (non-frost free preferred) for up to one week (please ship out Monday-Wednesday only; Canada: Monday-Tuesday only).
    - OR: Samples can be stored in plenty of dry ice for up to one week, replenishing daily (please ship out on Monday-Wednesday only; Canada: Monday-Tuesday only).
  - OR: Samples can be stored in liquid nitrogen vapor phase (ship out Monday-Wednesday only; Canada: Monday-Tuesday only).
- Please indicate on Specimen Transmittal Form the storage conditions used and time stored.

Shipping/Mailing:
- Ship specimens on Dry Ice overnight Monday-Wednesday (Monday-Tuesday from Canada) to prevent thawing due to delivery delays. Saturday and holiday deliveries cannot be accepted.
- Include all NRG Oncology paperwork in a sealed plastic bag and tape to the outside top of the Styrofoam box.
- Wrap frozen specimens of same type (i.e., all serum together, plasma together and whole bloods together) in absorbent shipping material and place each specimen type in a separate biohazard bag. Place specimen bags into the Styrofoam cooler and fill with plenty of dry ice (7-10 lbs/3.5kg minimum). **Add padding to avoid the dry ice from breaking the tubes.**
- Place Styrofoam coolers into outer cardboard box, and attach shipping label and UN3373 and UN1895 stickers to outer cardboard box.
- Multiple cases may be shipped in the same cooler, but make sure each one is in a separate bag and that there is enough room for plenty of dry ice. **Add padding to avoid the dry ice from breaking the tubes.**
- For questions regarding collection, shipping or to order a Blood Collection Kit, please e-mail RTOG@ucsf.edu or call (415)476-7864.

**Shipping Address:**
Courier Address (FedEx, UPS, etc.): For all Frozen Specimens
NRG Oncology Biospecimen Bank San Francisco
University of California San Francisco
2340 Sutter Street, Room S341
San Francisco, CA 94115
For questions, call 415-476-7864 or e-mail: RTOG@ucsf.edu
NRG ONCOLOGY URINE COLLECTION KIT INSTRUCTIONS

This Kit is for collection, processing, storage, and shipping of urine specimens.

**Kit Contents:**
- One (1) Sterile Urine collection cup
- Two 15 ml polypropylene centrifuge tubes
- Two 7 ml disposable pipettes
- Biohazard bags
- Absorbent paper towel
- Parafilm for sealing outside of tubes

**Preparation and Processing of Urine Specimens:**

**Process:**
- A clean catch urine specimen will be collected. To collect the specimen, use the following instructions:
  - Males should wipe clean the head of the penis and females need to wipe between the labia with soapy water/cleansing wipes to remove any contaminants.
  - After urinating a small amount into the toilet bowl to clear the urethra of contaminants, collect a sample of urine in the collection cup.
  - After 10-25 mL urine has been collected, remove the container from the urine stream without stopping the flow of urine.
  - Finish voiding the bladder into the toilet bowl.
- Aliquot 5-10 mls of Urine into each of two 15 ml polypropylene centrifuge tubes (disposable pipets are provided in the kit). Do not fill with more than 10 mls to avoid cracking of tubes due to expansion during freezing. Replace the cap and tighten on the tubes. Make sure the cap is not cross-threaded or placed on incorrectly or leaking will occur.
- Use parafilm to seal the cap around the outside rim of the urine tube to prevent leakage.
- Discard remaining Urine and collection cup.
- Label the specimen with the NRG Oncology study and case number, collection date and time, time point of collection, and clearly mark specimens as “urine”.
- Wrap Urine Tubes with absorbent material (paper towels) and place into biohazard bag and seal the bag. Freeze and store Urine samples in a -20°C or -80°C freezer until ready to ship.

**PLEASE MAKE SURE THAT EVERY SPECIMEN IS LABELED with NRG Oncology study and case numbers, collection date/time, and time point collected (e.g. pretreatment, post-treatment).**

**Storage and Shipping:**

**Freezing and Storage:**
- Urine specimens may be sent in batches or with other frozen biospecimens, if within 30-60 days of collection. Store at -20° C or -80°C (-70° C to -90° C) until ready to ship. If a -80°C Freezer is not available:
  - Samples can be stored short term in a -20° C freezer (non-frost free preferred) for up to one week (please ship out Monday-Wednesday only; Canada: Monday-Tuesday only).
  - Samples can be stored in plenty of Dry Ice for up to one week, replenishing daily (please ship out Monday-Wednesday only; Canada: Monday-Tuesday only).
- Please indicate on Specimen Transmittal Form the storage conditions used and time stored.

**Shipping/Mailing:**
- Ship specimens on Dry Ice overnight **Monday-Wednesday (Monday-Tuesday from Canada)** to prevent thawing due to delivery delays. Saturday and holiday deliveries cannot be accepted.
- Include all NRG Oncology paperwork in a sealed plastic bag and tape to the outside top of the Styrofoam box.
- Place sealed specimen bags into the Styrofoam cooler and fill with plenty of dry ice (7-10 lbs/3.5kg minimum). **Add padding to avoid the dry ice from breaking the tubes.**
- Place Styrofoam coolers into outer cardboard box, and attach shipping label and UN3373 and UN1895 stickers to outer cardboard box.
Multiple cases may be shipped in the same cooler, but make sure each one is in a separate bag and that there is enough room for plenty of dry ice. **Add padding to avoid the dry ice from breaking the tubes.**

Samples received thawed will be discarded, and a notification will be sent immediately to the Principal Investigator and Clinical Research Assistant of the submitting institution. The institution should send a subsequent sample, collected as close as possible to the original planned collection date.

For questions regarding ordering, collection, or shipping of a Urine Collection Kit, please e-mail RTOG@ucsf.edu or call (415) 476-7864 or fax (415) 476-5271.

**Shipping Address: FedEx/UPS/Courier address (For all frozen samples)**

Informed Consent Template for Cancer Treatment Trials (English Language)

RTOG 1205

Randomized Phase II Trial of Concurrent Bevacizumab and Re-Irradiation Versus Bevacizumab Alone as Treatment for Recurrent Glioblastoma.

This is a clinical trial, a type of research study. Your study doctor will explain the clinical trial to you. Clinical trials include only people who choose to take part. Please take your time to make your decision about taking part. You may discuss your decision with your friends and family. You can also discuss it with your health care team. If you have any questions, you can ask your study doctor for more explanation.

You are being asked to take part in this study because you have a brain tumor, called a glioblastoma or gliosarcoma, which has become worse after previous treatment.

Why is this study being done?

Bevacizumab is a commercially available drug that is FDA approved for the treatment of glioblastoma that has returned after treatment (recurrent glioblastoma). However, treatment with bevacizumab alone has only modestly improved survival in patients with this type of brain tumor. For this reason, researchers are evaluating other treatments, including bevacizumab combined with radiation. The purpose of this study is to determine whether adding radiation to bevacizumab is more effective than using bevacizumab alone to treat recurrent glioblastomas.

In this trial patients will be randomly assigned to receive either bevacizumab alone or bevacizumab and radiation therapy.

How many people will take part in the study?

About 178 people will take part in this study.

What will happen if I take part in this research study?

Before you begin the study ...

You will need to have the following exams, tests or procedures to find out if you can be in the study. These exams, tests or procedures are part of regular cancer care and may be done even if you do not join the study. If you have had some of them recently, they may not need to be repeated. This will be up to your study doctor.

- Magnetic resonance imaging (MRI) or computed tomography (CT) scan of the brain
  - An MRI is imaging using a strong magnetic field to look at one part of your body
A CT scan is a study using x-rays to look at one part of your body

- Laboratory tests for
  - Blood counts
  - Kidney function
  - Liver function
  - A sample of your urine will be tested
- History/physical examination
- Neurologic examination
- Evaluation of your ability to carry out daily activities
- Pregnancy test (if you are a woman of child-bearing potential)

**During the study**

If the exams, tests and procedures show that you can be in the study, and you choose to take part, then you will need the following tests and procedures. They are part of regular cancer care.

- Physical examination
- Neurologic examination
- Evaluation of your ability to carry out daily activities
- Laboratory tests for blood count and evaluation of urine
- MRI/CT scan
- Blood pressure monitoring

You will be "randomized" into one of the study groups described below. Randomization means that you are put into a group by chance. A computer program will place you in one of the study groups. Neither you nor your doctor can choose the group you will be in. You will have an equal chance of being placed in either group.

If you are in group 1 (often called "Arm 1"), you will receive bevacizumab alone. The bevacizumab will be given by vein (intravenously) every 2 weeks for as long as it is working and there are no intolerable side effects.

If you are in group 2 (often called "Arm 2"), you will receive bevacizumab and radiation therapy. The bevacizumab will be given by vein (intravenously) every 2 weeks for as long as it is working and there are no intolerable side effects. You will receive 10 treatments of radiation, which will be delivered daily (typically 5 treatments per week), for 2 weeks.
Study Plan

Another way to find out what will happen to you during the study is to read the chart below. Start reading at the top and read down the list, following the lines and arrows.

**Randomize**

(You will be in one Group or the other)

- **Group 1**
  - Bevacizumab every 2 weeks

- **Group 2**
  - Radiation therapy for 2 weeks
  - PLUS
  - Bevacizumab every 2 weeks

**How long will I be in the study?**

If you are in Group 1, you will be asked to take bevacizumab alone every two weeks as long as it is working and there are no intolerable side effects. If you are in Group 2, you will take bevacizumab 2 weeks before radiation therapy, during radiation therapy, and then every 2 weeks after radiation therapy as long as it is working and there are no intolerable side effects. The radiation will be given to you over 2 weeks.

You will be followed every 8 weeks while on treatment and then also if you are removed from protocol treatment. Follow-up will continue every 8 weeks for 1 year, then every 6 months for 1 year, then annually. If you are unable to be seen in clinic by your study doctor, you may be contacted by the study doctor or the clinic staff.

**Can I stop being in the study?**

Yes. You can decide to stop at any time. Tell the study doctor if you are thinking about stopping or decide to stop. He or she will tell you how to stop safely.

It is important to tell the study doctor if you are thinking about stopping so any risks from the bevacizumab or radiation plus bevacizumab can be evaluated by your doctor.
Another reason to tell your doctor that you are thinking about stopping is to discuss what follow-up care and testing could be most helpful for you.

The study doctor may stop you from taking part in this study at any time if he/she believes it is in your best interest; if you do not follow the study rules; or if the study is stopped.

**What side effects or risks can I expect from being in the study?** *(10/3/16)*

You may have side effects while on the study. Everyone taking part in the study will be watched carefully for any side effects. However, doctors don’t know all the side effects that may happen. Side effects may be mild or very serious. Your health care team may give you medicines to help lessen side effects (for example, if a blood clot develops, you may be started on a blood thinner). Many side effects go away soon after you stop radiation therapy or stop taking the bevacizumab. In some cases, side effects can be serious, long lasting, or may never go away. There also is a risk of death.

You should talk to your study doctor about any side effects that you have while taking part in the study.

If you choose to take part in this study, there is a risk that:
- You may lose time at work or home and spend more time in the hospital or doctor’s office than usual
- You may be asked sensitive or private questions which you normally do not discuss

The radiation and bevacizumab used in this study may affect how different parts of your body work such as your liver, kidneys, heart, and blood. The study doctor will be testing your blood and will let you know if changes occur that may affect your health.

There is also a risk that you could have side effects from the study drug(s)/study approach.

Here are important points about side effects:
- The study doctors do not know who will or will not have side effects.
- Some side effects may go away soon, some may last a long time, or some may never go away.
- Some side effects may interfere with your ability to have children.
- Some side effects may be serious and may even result in death.

Here are important points about how you and the study doctor can make side effects less of a problem:
- Tell the study doctor if you notice or feel anything different so they can see if you are having a side effect.
- The study doctor may be able to treat some side effects.
• The study doctor may adjust the study drugs to try to reduce side effects.

The tables below show the most common and the most serious side effects that researchers know about. There might be other side effects that researchers do not yet know about. If important new side effects are found, the study doctor will discuss these with you.

Possible Side Effects of Radiation to the Brain (6/23/14)

**COMMON, SOME MAY BE SERIOUS**

<table>
<thead>
<tr>
<th>In 100 people receiving radiation to the brain, more than 20 and up to 100 may have:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Scalp redness or soreness</td>
</tr>
<tr>
<td>• Hair loss, which may be temporary or permanent</td>
</tr>
<tr>
<td>• Ear/ear canal reactions, possibly resulting in a short-term hearing loss</td>
</tr>
<tr>
<td>• Fatigue</td>
</tr>
<tr>
<td>• Lethargy</td>
</tr>
<tr>
<td>• Temporary aggravation of brain tumor symptoms such as headaches, seizures, or weakness</td>
</tr>
</tbody>
</table>

**OCCASIONAL, SOME MAY BE SERIOUS**

<table>
<thead>
<tr>
<th>In 100 people receiving radiation to the brain, from 4 to 20 may have:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Mental slowing</td>
</tr>
<tr>
<td>• Permanent hearing loss</td>
</tr>
<tr>
<td>• Cataracts</td>
</tr>
<tr>
<td>• Behavioral change</td>
</tr>
<tr>
<td>• Nausea</td>
</tr>
<tr>
<td>• Vomiting</td>
</tr>
<tr>
<td>• Temporary worsening of existing neurological deficits, such as decreased vision, drowsiness, and weakness of your arms and legs</td>
</tr>
<tr>
<td>• Endocrine problems causing abnormalities in the level of some hormones related to changes to the pituitary gland</td>
</tr>
<tr>
<td>• Dry mouth or altered taste</td>
</tr>
</tbody>
</table>

**RARE, AND SERIOUS**

<table>
<thead>
<tr>
<th>In 100 people receiving radiation to the brain, 3 or fewer may have:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Severe local damage to normal brain tissue, a condition called necrosis (tissue deterioration). Radiation necrosis can mimic recurrent brain tumor and may require surgery for diagnosis and treatment.</td>
</tr>
<tr>
<td>• Injury to the eyes with the possibility of blindness</td>
</tr>
<tr>
<td>• Development of other tumors (either benign or malignant)</td>
</tr>
</tbody>
</table>
### Possible Side Effects of Bevacizumab (6/23/14 - 10/3/16)

**Table Version Date:** August 1, 2013 - May 23, 2016

<table>
<thead>
<tr>
<th>COMMON, SOME MAY BE SERIOUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>In 100 people receiving bevacizumab, more than 20 and up to 100 may have:</td>
</tr>
<tr>
<td>- High blood pressure which may cause headache or blurred vision</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>OCCASIONAL, SOME MAY BE SERIOUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>In 100 people receiving bevacizumab, from 4 to 20 may have:</td>
</tr>
<tr>
<td>- Anemia which may require blood transfusion</td>
</tr>
<tr>
<td>- Low white cell count that may increase the risk of infection</td>
</tr>
<tr>
<td>- Infection, including collection of pus in the belly or rectum</td>
</tr>
<tr>
<td>- Abnormal heartbeat which may cause palpitations or fainting</td>
</tr>
<tr>
<td>- Pain in the belly, rectum, chest, joints, muscles, or tumor</td>
</tr>
<tr>
<td>- Low appetite, constipation, diarrhea, heartburn, nausea, vomiting, or dehydration</td>
</tr>
<tr>
<td>- Internal bleeding which may cause black tarry stool, blood in vomit, coughing up of blood, or blood in urine</td>
</tr>
<tr>
<td>- Bleeding from other sites, including the vagina or nose</td>
</tr>
<tr>
<td>- Blockage of internal organs which may cause vomiting or inability to pass stool</td>
</tr>
<tr>
<td>- Sores in mouth</td>
</tr>
<tr>
<td>- Allergic reaction during or after infusion of bevacizumab which may cause fever, chills, rash, itching, hives, low blood pressure, wheezing, shortness of breath, swelling of the face or throat</td>
</tr>
<tr>
<td>- Delay in healing of wounds or spontaneous opening of wounds</td>
</tr>
<tr>
<td>- Weight loss, tiredness, or dizziness</td>
</tr>
<tr>
<td>- Damage to the jawbone which may cause loss of teeth</td>
</tr>
<tr>
<td>- Headache</td>
</tr>
<tr>
<td>- Numbness, tingling, or pain in the fingers or toes</td>
</tr>
<tr>
<td>- Hoarseness, stuffy nose, or cough</td>
</tr>
<tr>
<td>- Blood clot in limbs or lungs which may cause swelling, pain, or shortness of breath</td>
</tr>
<tr>
<td>- Leakage of protein in the urine, which can rarely lead to damage to the kidney</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>RARE, AND SERIOUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>In 100 people receiving bevacizumab, 3 or fewer may have:</td>
</tr>
</tbody>
</table>
• Clots in the arteries, causing stroke (which may cause paralysis or weakness) or heart attack (which may cause chest pain or shortness of breath). This risk is significantly increased in patients who are elderly or with history of diabetes.
• Heart failure which may cause shortness of breath, swelling of ankles, or tiredness.
• Bowel perforation (a tear in the bowel) that can cause pain or bleeding and require surgery to repair.
• A tear or hole (fistula) in internal organs such as the nose, throat, lungs, esophagus, rectum, or vagina. These conditions may cause serious infections or bleeding and require surgery to repair.
• Flesh-eating bacteria syndrome, an infection in the deep layers of skin.
• Bleeding in the tumor, brain, belly, or lungs which may cause confusion, blood in stool or coughing up blood.
• Brain damage which may cause headache, seizure, blindness (also known as Reversible Posterior Leukoencephalopathy Syndrome).
• Kidney damage which may require dialysis.

Additional Notes on Possible Side Effects for Bevacizumab:
• Risk in children or adolescents: abnormal bone changes which may interfere with growth.
• Risk in pre-menopausal women: more likely to develop menopause when taking bevacizumab.

<table>

**RARE, AND SERIOUS**

In 100 people receiving bevacizumab, 3 or fewer may have:
• Clots in the arteries, causing stroke (which may cause paralysis or weakness) or heart attack (which may cause chest pain or shortness of breath). This risk is significantly increased in patients who are elderly or with history of diabetes
• Heart failure which may cause shortness of breath, swelling of ankles, and tiredness
• Bowel perforation (a tear in the bowel) that can cause pain or bleeding and require surgery to repair
• A tear or hole (fistula) in internal organs such as the nose, throat, lungs, esophagus, rectum, or vagina. These conditions may cause serious infections or bleeding and require surgery to repair
• Sores in the throat
• Flesh-eating bacteria syndrome, an infection in the deep layers of skin
• Bleeding in the tumor, brain, belly or lungs which may cause confusion, blood in stool or coughing up blood
• Brain damage which may cause headache, seizure, blindness (also known as Reversible Posterior Leukoencephalopathy Syndrome)
• Kidney damage which may require dialysis
• Redness, pain or peeling of palms and soles

Additional Notes on Possible Side Effects for Bevacizumab:
• Risk in children or adolescents: abnormal bone changes which may interfere with growth.
• Risk in pre-menopausal women: more likely to develop menopause when taking bevacizumab.

Reproductive risks: You should not become pregnant or father a baby while on this study and for at least 6 months after because the drugs in this study can affect an unborn baby. If you are a woman of childbearing age, and have not been surgically sterilized (tubal ligation or hysterectomy), you must have a pregnancy test before enrolling in this study. Women should not breastfeed a baby while on this study. It is important you understand that you need to use birth control while on this study.

Check with your study doctor about what kind of birth control methods to use and how long to use them. Some methods might not be approved for use in this study. If you would like to have children in the future, you should talk to your physician about this. For more information about risks and side effects, ask your study doctor.

Are there benefits to taking part in the study?
Taking part in this study may or may not make your health better. While doctors hope that adding radiation to bevacizumab will be more useful against cancer compared to bevacizumab alone, there is no proof of this yet. We do know that the information from this study will help doctors learn more about combining bevacizumab and radiation as a treatment for cancer. This information could help future cancer patients.

What other choices do I have if I do not take part in this study?
Your other choices may include:
- Getting treatment or care for your cancer without being in a study
- Taking part in another study
- Getting no treatment
- Other chemotherapies your physician can discuss with you.

Talk to your doctor about your choices before you decide if you will take part in this study.

**Will my medical information be kept private? (4/15/14)**
We will do our best to make sure that the personal information in your medical record will be kept private. However, we cannot guarantee total privacy. Your personal information may be given out if required by law. If information from this study is published or presented at scientific meetings, your name and other personal information will not be used.

Organizations that may look at and/or copy your medical records for research, quality assurance, and data analysis include:
- NRG Oncology
- The National Cancer Institute (NCI) and other government agencies, like the Food and Drug Administration (FDA), involved in keeping research safe for people

A description of this clinical trial will be available on [http://www.ClinicalTrials.gov](http://www.ClinicalTrials.gov), as required by U.S. Law. This Web site will not include information that can identify you. At most, the Web site will include a summary of the results. You can search this Web site at any time.

*Note to Informed Consent Authors: the above paragraph complies with the new FDA regulation found at 21 CFR 50.25(c) and must be included verbatim in all informed consent documents. The text in this paragraph cannot be revised.*

**What are the costs of taking part in this study?**
You and/or your health plan/insurance company will need to pay for some or all of the costs of treating your cancer in this study. Some health plans will not pay these costs for people taking part in studies. Check with your health plan or insurance company to find out what they will pay for. Taking part in this study may or may not cost your insurance company more than the cost of getting regular cancer treatment.

Bevacizumab is FDA-approved for recurrent glioblastoma and will be billed to your insurance company. Radiation therapy will be billed to your insurance company. All study related procedures are part of standard monitoring for patients and will be billed to your insurance company.

You will not be paid for taking part in this study.
For more information on clinical trials and insurance coverage, you can visit the National Cancer Institute’s Web site at http://cancer.gov/clinicaltrials/understanding/insurance-coverage. You can print a copy of the “Clinical Trials and Insurance Coverage” information from this Web site.

Another way to get the information is to call 1-800-4-CANCER (1-800-422-6237) and ask them to send you a free copy.

**What happens if I am injured because I took part in this study?**

It is important that you tell your study doctor, __________________ [investigator’s name(s)], if you feel that you have been injured because of taking part in this study. You can tell the doctor in person or call him/her at __________________ [telephone number].

You will get medical treatment if you are injured as a result of taking part in this study. You and/or your health plan will be charged for this treatment. The study will not pay for medical treatment.

**What are my rights if I take part in this study?**

Taking part in this study is your choice. You may choose either to take part or not to take part in the study. If you decide to take part in this study, you may leave the study at any time. No matter what decision you make, there will be no penalty to you and you will not lose any of your regular benefits. Leaving the study will not affect your medical care. You can still get your medical care from our institution.

We will tell you about new information or changes in the study that may affect your health or your willingness to continue in the study.

In the case of injury resulting from this study, you do not lose any of your legal rights to seek payment by signing this form.

**Who can answer my questions about the study?**

You can talk to your study doctor about any questions or concerns you have about this study. Contact your study doctor __________________ [name(s)] at __________________ [telephone number].

For questions about your rights while taking part in this study, call the __________________ [name of center] Institutional Review Board (a group of people who review the research to protect your rights) at __________________
(telephone number). [Note to Local Investigator: Contact information for patient representatives or other individuals in a local institution who are not on the IRB or research team but take calls regarding clinical trial questions can be listed here.]

*You may also call the Operations Office of the NCI Central Institutional Review Board (CIRB) at 888-657-3711 (from the continental US only). [*Only applies to sites using the CIRB.]*

Please note: This section of the informed consent form is about additional research studies that are being done with people who are taking part in the main study. You may take part in these additional studies if you want to. You can still be a part of the main study even if you say ‘no’ to taking part in any of these additional studies.

You can say “yes” or “no” to each of the following studies. Please mark your choice for each study.

Consent Form for Use of Tissue for Research

About Using Tissue for Research (8/20/15)

You have had a biopsy (or surgery) to see if you have cancer. Your doctor removed some body tissue to do some tests. The results of these tests were given to you by your doctor and will be used to plan your care.

We would like to keep some of the tissue that is left over for future research. If you agree, this tissue will be kept and may be used in research to learn more about cancer and other diseases.

In addition to the tumor tissue, if you agree, you will have blood drawn before you start treatment and at 8 weeks after you begin treatment. We would like to keep about 2 tablespoons of blood at each of these times. Urine will be collected before you start treatment and at 8 weeks after you begin treatment also. This blood and urine will be kept to be used in research to learn more about cancer and other diseases.

Your tissue/blood/urine may be helpful for research whether you do or do not have cancer. The research that may be done with your tissue/blood/urine is not designed specifically to help you. It might help people who have cancer and other diseases in the future.

Reports about research done with your tissue will not be given to you or your doctor. These reports will not be put in your health record. The research will not have an effect on your care.

Things to Think About
The choice to let us keep the left over tissue/blood/urine for future research is up to you. No matter what you decide to do, it will not affect your care.

If you decide now that your tissue/blood/urine can be kept for research, you can change your mind at any time. Just contact us and let us know that you do not want us to use your tissue/blood/urine. Then any tissue/blood/urine that remains will no longer be used for research; any remaining tissue will be returned and any remaining blood and urine will be destroyed.

In the future, people who do research may need to know more about your health. While the doctor/institution may give them reports about your health, it will not give them your name, address, phone number, or any other information that will let the researchers know who you are.

Sometimes tissue/blood/urine is (are) used for genetic research (about diseases that are passed on in families). Even if your tissue/blood/urine is (are) used for this kind of research, the results will not be put in your health records.

Your tissue/blood/urine will be used only for research and will not be sold. The research done with your tissue/blood/urine may help to develop new products in the future.

**Benefits**

The benefits of research using tissue/blood/urine include learning more about what causes cancer and other diseases, how to prevent them, and how to treat them.

**Risks (11/20/13)**

The greatest risk to you is the release of information from your health records. We will do our best to make sure that your personal information will be kept private. The chance that this information will be given to someone else is very small.

Some of your genetic and health information may be placed in central databases that may be public, along with information from many other people. Information that could directly identify you will not be included. The samples are given a code to protect your privacy before they are used. Any related information given to researchers will also be coded. Researchers will receive the code instead of any information that might directly identify you.

There can be a risk in knowing genetic information. New health information about inherited traits that might affect you or your blood relatives could be found during a research study. Even though your genes are unique, you share some of the same genes with your blood relatives.

Although we are not able to know all of the risks from taking part in research on inherited traits, we believe that the risks to you and your family are very low, because your samples will be coded. Research results will not be returned to you or your doctor.
Very rarely health or genetic information could be misused by employers, insurance companies, and others. For example, life insurance companies may charge a higher rate based on this information.

Many states have laws to protect against genetic discrimination [list appropriate state information if your state or locality has such laws]. Additionally, a federal law called the Genetic Information Non-Discrimination Act, or GINA, is in effect. This law prohibits health insurer or employer discrimination. The law does not include other types of misuse by life insurance, disability, or long term care insurance. To learn more about the GINA Law, please ask [Note to local investigator: Contact information for patient representatives or other individuals in a local institution who are not on the IRB or research team but take calls regarding clinical trial questions can be listed here.]

Making Your Choice

Please read each sentence below and think about your choice. After reading each sentence, circle "Yes" or "No". If you have any questions, please talk to your doctor or nurse, or call our research review board at IRB's phone number.

No matter what you decide to do, it will not affect your care.

1. My specimens may be kept for use in research to learn about, prevent, or treat cancer, as follows:
   - Tissue □ Yes □ No
   - Blood □ Yes □ No
   - Urine □ Yes □ No

2. My specimens may be kept for use in research to learn about, prevent, or treat other health problems (for example: diabetes, Alzheimer's disease, or heart disease), as follows:
   - Tissue □ Yes □ No
   - Blood □ Yes □ No
   - Urine □ Yes □ No

3. Someone may contact me in the future to ask me to take part in more research. □ Yes □ No

Where can I get more information?

You may call the National Cancer Institute's Cancer Information Service at:

1-800-4-CANCER (1-800-422-6237)

You may also visit the NCI Web site at http://cancer.gov/
• For NCI’s clinical trials information, go to: http://cancer.gov/clinicaltrials/

• For NCI’s general information about cancer, go to http://cancer.gov/cancerinfo/

You will get a copy of this form. If you want more information about this study, ask your study doctor.

**Signature**

I have been given a copy of all _____ [insert total of number of pages] pages of this form. I have read it or it has been read to me. I understand the information and have had my questions answered. I agree to take part in this study.
